RFC 231: Remote Service Intents

Draft

10 Pages

Abstract

10 point Arial Centered.

OSGi Remote Services are a powerful, flexible way to expose OSGi services from one framework into another.

The model allows great flexibility in the serialization, transport and wire formats that are used by the Remote Services implementation, meaning that Remote Services can be used across many sorts of distributed system. Unfortunately this flexibility offers few guarantees about the types of object that may be safely used in the Remote Service API. This RFC aims to provide some basic remote service intents that can be relied upon to provide support for simple synchronous and asynchronous remote services.

DISTRIBUTION AND FEEDBACK LICENSE, Version 2.0

The OSGi Alliance hereby grants you a limited copyright license to copy and display this document (the “Distribution”) in any medium without fee or royalty. This Distribution license is exclusively for the purpose of reviewing and providing feedback to the OSGi Alliance. You agree not to modify the Distribution in any way and further agree to not participate in any way in the making of derivative works thereof, other than as a necessary result of reviewing and providing feedback to the Distribution. You also agree to cause this notice, along with the accompanying consent, to be included on all copies (or portions thereof) of the Distribution. The OSGi Alliance also grants you a perpetual, non-exclusive, worldwide, fully paid-up, royalty free, limited license (without the right to sublicense) under any applicable copyrights, to create and/or distribute an implementation of the Distribution that: (i) fully implements the Distribution including all its required interfaces and functionality; (ii) does not modify, subset, superset or otherwise extend the OSGi Name Space, or include any public or protected packages, classes, Java interfaces, fields or methods within the OSGi Name Space other than those required and authorized by the Distribution. An implementation that does not satisfy limitations (i)-(ii) is not considered an implementation of the Distribution, does not receive the benefits of this license, and must not be described as an implementation of the Distribution. “OSGi Name Space” shall mean the public class or interface declarations whose names begin with “org.osgi” or any recognized successors or replacements thereof. The OSGi Alliance expressly reserves all rights not granted pursuant to these limited copyright licenses including termination of the license at will at any time.

EXCEPT FOR THE LIMITED COPYRIGHT LICENSES GRANTED ABOVE, THE OSGi ALLIANCE DOES NOT GRANT, EITHER EXPRESSLY OR IMPLIEDLY, A LICENSE TO ANY INTELLECTUAL PROPERTY IT, OR ANY THIRD PARTIES, OWN OR CONTROL. Title to the copyright in the Distribution will at all times remain with the OSGi Alliance. The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted therein are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

THE DISTRIBUTION IS PROVIDED “AS IS,” AND THE OSGi ALLIANCE (INCLUDING ANY THIRD PARTIES THAT HAVE CONTRIBUTED TO THE DISTRIBUTION) MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, OR TITLE; THAT THE CONTENTS OF THE DISTRIBUTION ARE SUITABLE FOR ANY PURPOSE; NOR THAT THE IMPLEMENTATION OF SUCH CONTENTS WILL NOT INFRINGE ANY THIRD PARTY PATENTS, COPYRIGHTS, TRADEMARKS OR OTHER RIGHTS.

NEITHER THE OSGi ALLIANCE NOR ANY THIRD PARTY WILL BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF OR RELATING TO ANY USE OR DISTRIBUTION OF THE DISTRIBUTION.

Implementation of certain elements of this Distribution may be subject to third party intellectual property rights, including without limitation, patent rights (such a third party may or may not be a member of the OSGi Alliance). The OSGi Alliance is not responsible and shall not be held responsible in any manner for identifying or failing to identify any or all such third party intellectual property rights.

The Distribution is a draft. As a result, the final product may change substantially by the time of final publication, and you are cautioned against relying on the content of this Distribution. You are encouraged to update any implementation of the Distribution if and when such Distribution becomes a final specification.

The OSGi Alliance is willing to receive input, suggestions and other feedback (“Feedback”) on the Distribution. By providing such Feedback to the OSGi Alliance, you grant to the OSGi Alliance and all its Members a non-exclusive, non-transferable,

worldwide, perpetual, irrevocable, royalty-free copyright license to copy, publish, license, modify, sublicense or otherwise distribute and exploit your Feedback for any purpose. Likewise, if incorporation of your Feedback would cause an implementation of the Distribution, including as it may be modified, amended, or published at any point in the future ("Future Specification"), to necessarily infringe a patent or patent application that you own or control, you hereby commit to grant to all implementers of such Distribution or Future Specification an irrevocable, worldwide, sublicenseable, royalty free license under such patent or patent application to make, have made, use, sell, offer for sale, import and export products or services that implement such Distribution or Future Specification. You warrant that (a) to the best of your knowledge you have the right to provide this Feedback, and if you are providing Feedback on behalf of a company, you have the rights to provide Feedback on behalf of your company; (b) the Feedback is not confidential to you and does not violate the copyright or trade secret interests of another; and (c) to the best of your knowledge, use of the Feedback would not cause an implementation of the Distribution or a Future Specification to necessarily infringe any third-party patent or patent application known to you. You also acknowledge that the OSGi Alliance is not required to incorporate your Feedback into any version of the Distribution or a Future Specification.

I HEREBY ACKNOWLEDGE AND AGREE TO THE TERMS AND CONDITIONS DELINEATED ABOVE.

1 Introduction

OSGi Remote Services were introduced in the OSGi Enterprise Specification version 4.2. Remote Services are a powerful, flexible way to expose OSGi services from one framework into another. The Remote Services specification chapter is deliberately short of implementation details, which allows great flexibility in the serialization, transport and wire formats that are used by the Remote Services implementation.

Remote Services can therefore be used across many sorts of distributed system. Unfortunately this flexibility offers few guarantees about the types of object that may be safely used in the Remote Service API. Service intents offer a mechanism for services to express their distribution requirements, however there are no standard intents that can be used.

The requirements for this RFC relate to two separate RFP/RFC documents, both of which require guarantees from the Remote Services implementation. The first RFC is RFC 183, which makes use of Remote Services as a

means of interacting with remote OSGi frameworks in a distributed system, and the second is RFP 184, which provides support for natively asynchronous calls.

The purpose of this RFC is to define intents that can be relied upon to provide support for these simple synchronous and asynchronous remote service operations.

2 Application Domain

Remotable OSGi services declare a remotable service interface to other OSGi frameworks in a similar way to local OSGi services declaring their interfaces to other bundles. For local services the Java Virtual machine and the OSGi framework ensure that the method parameters and return types are able to be passed safely.

For remote services the Java virtual machine and OSGi framework are not able to make the same guarantees. The serialization and deserialization process may, or may not, be able to correctly handle the remote method call.

In addition, remote invocations are inevitably based on some form of asynchronous communication, even if this is made synchronous by an intermediate network layer. For transports which are truly asynchronous there can be advantages when handling methods with asynchronous return types.

3 Problem Description

Remote Services are required to support primitive types and Strings as arguments and return types, however the OSGi specifications also define DTOs as an easily serializable data representation.

Furthermore, asynchronous methods may return an OSGi Promise, Future or CompletableFuture. For asynchronous transports these types should be able to be handled natively, and as long as the result of the asynchronous method call is easily serializable this should also be possible to handle.

In the case of an asynchronous service, a communications failure or partition may prevent a response from ever being received. Synchronous services block at this point, and asynchronous services simply fail to progress.

Most remote systems typically have a heartbeat and timeout to prevent the system from hanging. Remote services should have a timeout configuration parameter to prevent the system from hanging in a state which is difficult to diagnose.

4 Requirements

RSI 0010: The solution **MUST** define a way for remote services to use DTOs as a remote return type

RSI 0020: The solution **MUST** define a way for remote services to return asynchronous results using OSGi Promises, Java Futures and Java CompletableFutures. Implementations **MAY** support this mode of operation.

RDI 0030: The solution **MUST** define a way for remote services to set an invocation timeout.

5 Technical Solution

Remote Services is a long-standing OSGi specification which provides a generic set of rules for the provision of remote OSGi service invocations. Remote Services are declared using the “service.exported.interfaces” property on a registered OSGi service.

Selection of a Remote Service Provider can be performed in one of two ways:

- The service.exported.configs can be used to limit the remote service to providers that support a given configuration type
- The service.exported.configs can be used to limit the remote service to providers that support a given set of intents type

These two mechanisms may superficially seem identical, however intents and configuration types are very different. An intent is a generic expression of a requirement that the remote service has for how it is distributed. For example the requirement for a secure transport layer would be expressed as an intent. Importantly an intent makes no further statement about the low-level implementation of the Remote Services provider. A configuration type, however, is an expression of interoperation between the two parties in a remote service invocation, for example a configuration type might be declared for SOAP over HTTP web services. The configuration type guarantees sufficient information will be supplied so that different remote services implementations can interoperate with one another.

The result of this difference is that a configuration type is a highly restrictive and detailed restriction. It is therefore typically used to identify a single remote services implementation. Whilst this does permit a remote service to select a provider which supports the features it requires, it is almost impossible to provide an exhaustive list of providers that can be used.

Remote Service Intents are therefore the most appropriate mechanism to use when identifying broad feature support required from a Remote Services Provider. This RFC therefore proposes to define several intents for common use cases.

5.1 Synchronous Remote Services

Remote Services Implementations are required to support services that:

- Expose a single Java interface (not a class type)
- Use only the OSGi scalar types, or arrays/Lists of the OSGi scalar types as method parameters and return values.

This model allows a significant number of synchronous remote services to be exported, but it is also quite limited. The lack of structured data transfer object types (DTOs), for example, means that most OSGi specifications are not able to depend on remote services.

This RFC therefore proposes the “osgi.basic” intent, with the following minimum levels of support:

5.1.1 Supported Service Interface

- The remote service exposes only a single Java interface declaring zero or more methods. The interface may extend other Java interfaces.
- The methods' parameters and return types are permitted to be Java primitives or the OSGi scalar types
- The methods' parameters and return types are permitted to be arrays of Java primitives or the OSGi scalar types.
- The methods' parameters and return types are permitted to be Lists of the OSGi scalar types, however the List implementation may not be the same on both sides of the remote call (for example a Linked List from the client may be an ArrayList on the server or vice versa)
- The methods parameters and return types of the interface are permitted to be Sets of the OSGi Scalar types, using equals() to determine identity. Iteration order may not be maintained between the client and the server. SortedSet need not be supported as a parameter or return due to the difficulties in serializing a Comparator.
- The methods' parameters and return types are permitted to be Collections or Iterables of the OSGi scalar types, however the implementation may not be the same on both sides (for example a Linked List from the client may be a HashSet on the server)
- The methods parameters and return types of the interface are permitted to be Maps where the keys and values are OSGi Scalar types, using equals() to determine identity for the keys. Iteration order may not be maintained between the client and the server. SortedMap need not be supported as a parameter or return due to the difficulties in serializing a Comparator.
- Additionally, method parameters and return types that conform to the OSGi DTO rules are supported. DTOs may also be used in Arrays, Lists, Sets, Collections, Iterables, and as the values in Maps.

5.1.2 Configurable timeout behaviour

The implementation of a Remote Services provider is entirely opaque, it may use a synchronous request response protocol over TCP, an asynchronous UDP based messaging provider, or even by writing to the file system. In many cases there will be no feedback mechanism if the remote call hangs, or if the remote node fails, and so the local client will must decide to either block indefinitely, or to fail with an exception after a

certain amount of time has elapsed. As it is rarely a good idea to block indefinitely most remote services providers will throw an Exception after the timeout has elapsed.

A remote services provider must be able to service a wide variety of different remote service invocations across many services, therefore it is difficult to identify a sensible timeout for the remote service invocation. Some calls may be quick, and so a ten second timeout is desirable for rapid failure detection, other calls may be long-running, and a two minute timeout too short. It therefore makes sense to allow the remote service to declare its own timeout.

To declare a timeout the remoteable service may provide a property “osgi.basic.timeout” which provides a timeout value in milliseconds. The value may be declared as a String or as a Number, which will be converted into a Long. The timeout value is used to limit the maximum time for which a remote service client will be blocked waiting for a response when calling methods on this service. In the event that the invocation reaches the timeout value the client will receive a ServiceException with its type set to REMOTE.

Note that due to the inherent complexities of distributed systems it is not known whether a timed out invocation is finished, still executing, or never started executing. It is up to the client application to ensure that failures of this kind are resolved appropriately.

5.2 Asynchronous Remote Services

Some service invocations operate asynchronously, returning quickly and continuing to process in the background. For void methods with no completion notifications this is simple to achieve remotely, but more useful scenarios are difficult to support without using higher-level abstractions to represent the eventual result.

This RFC therefore proposes the “osgi.async” intent as an extension of the “osgi.basic” intent, with the following additional minimum levels of support:

5.2.1 Supported Service Interface

The methods’ return types are permitted to be one of the following “asynchronous holders”

- `java.util.concurrent.Future`
- `java.util.concurrent.CompletableFuture`
- `org.osgi.util.promise.Promise`

If the return type is an asynchronous holder then the eventual value must either be

- A supported “osgi.basic” type
- The `java.lang.Void` type, which will always be null.

5.2.2 Timeout behaviour

Asynchronous calls may time out in exactly the same way as synchronous calls do. In this case the asynchronous holder is failed with the same exception as would be thrown in a synchronous call.

6 Data Transfer Objects

RFC 185 defines Data Transfer Objects as a generic means for management solutions to interact with runtime entities in an OSGi Framework. DTOs provides a common, easily serializable representation of the technology.

For all new functionality added to the OSGi Framework the question should be asked: would this feature benefit from a DTO? The expectation is that in most cases it would.

The DTOs for the design in this RFC should be described here and if there are no DTOs being defined an explanation should be given explaining why this is not applicable in this case.

This section is optional and could also be provided in a separate RFC.

7 Javadoc

Please include Javadoc of any new APIs here, once the design has matured. Instructions on how to export Javadoc for inclusion in the RFC can be found here: <https://www.osgi.org/members/RFC/Javadoc>

8 Considered Alternatives

For posterity, record the design alternatives that were considered but rejected along with the reason for rejection. This is especially important for external/earlier solutions that were deemed not applicable.

9 Security Considerations

Description of all known vulnerabilities this may either introduce or address as well as scenarios of how the weaknesses could be circumvented.
