

## **Connect**

Draft

33 Pages

## **Abstract**

OSGi Connect provides a mechanism to create and launch an OSGi Framework instance that can install bundles which use content managed outside of the Framework itself. For example, to provide things like resource loading, class loading, bundle entry content and the bundle manifest headers. Among other things this allows for bundles to exist and be installed into the framework from the flat class path, the Java Platform Module System module path, a jlink image, or a native image.

### **DISTRIBUTION AND FEEDBACK LICENSE, Version 2.0**

The OSGi Alliance hereby grants you a limited copyright license to copy and display this document (the "Distribution") in any medium without fee or royalty. This Distribution license is exclusively for the purpose of reviewing and providing feedback to the OSGi Alliance. You agree not to modify the Distribution in any way and further agree to not participate in any way in the making of derivative works thereof, other than as a necessary result of reviewing and providing feedback to the Distribution. You also agree to cause this notice, along with the accompanying consent, to be included on all copies (or portions thereof) of the Distribution. The OSGi Alliance also grants you a perpetual, non-exclusive, worldwide, fully paid-up, royalty free, limited license (without the right to sublicense) under any applicable copyrights, to create and/or distribute an implementation of the Distribution that: (i) fully implements the Distribution including all its required interfaces and functionality; (ii) does not modify, subset, superset or otherwise extend the OSGi Name Space, or include any public or protected packages, classes, Java interfaces, fields or methods within the OSGi Name Space other than those required and authorized by the Distribution. An implementation that does not satisfy limitations (i)-(ii) is not considered an implementation of the Distribution, does not receive the benefits of this license, and must not be described as an implementation of the Distribution. "OSGi Name Space" shall mean the public class or interface declarations whose names begin with "org.osgi" or any recognized successors or replacements thereof. The OSGi Alliance expressly reserves all rights not granted pursuant to these limited copyright licenses including termination of the license at will at any time.

EXCEPT FOR THE LIMITED COPYRIGHT LICENSES GRANTED ABOVE, THE OSGI ALLIANCE DOES NOT GRANT, EITHER EXPRESSLY OR IMPLIEDLY, A LICENSE TO ANY INTELLECTUAL PROPERTY IT, OR ANY THIRD PARTIES, OWN OR CONTROL. Title to the copyright in the Distribution will at all times remain with the OSGI Alliance. The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted therein are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

THE DISTRIBUTION IS PROVIDED "AS IS," AND THE OSGI ALLIANCE (INCLUDING ANY THIRD PARTIES THAT HAVE CONTRIBUTED TO THE DISTRIBUTION) MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, OR TITLE; THAT THE CONTENTS OF THE DISTRIBUTION ARE SUITABLE FOR ANY PURPOSE; NOR THAT THE IMPLEMENTATION OF SUCH CONTENTS WILL NOT INFRINGE ANY THIRD PARTY PATENTS, COPYRIGHTS, TRADEMARKS OR OTHER RIGHTS.

NEITHER THE OSGI ALLIANCE NOR ANY THIRD PARTY WILL BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF OR RELATING TO ANY USE OR DISTRIBUTION OF THE DISTRIBUTION.

Implementation of certain elements of this Distribution may be subject to third party intellectual property rights, including without limitation, patent rights (such a third party may or may not be a member of the OSGi Alliance). The OSGi Alliance is not responsible and shall not be held responsible in any manner for identifying or failing to identify any or all such third party intellectual property rights.

The Distribution is a draft. As a result, the final product may change substantially by the time of final publication, and you are cautioned against relying on the content of this Distribution. You are encouraged to update any implementation of the Distribution if and when such Distribution becomes a final specification.

The OSGi Alliance is willing to receive input, suggestions and other feedback ("Feedback") on the Distribution. By providing such Feedback to the OSGi Alliance, you grant to the OSGi Alliance and all its Members a non-exclusive, non-transferable,

Draft December 16, 2019

worldwide, perpetual, irrevocable, royalty-free copyright license to copy, publish, license, modify, sublicense or otherwise distribute and exploit your Feedback for any purpose. Likewise, if incorporation of your Feedback would cause an implementation of the Distribution, including as it may be modified, amended, or published at any point in the future ("Future Specification"), to necessarily infringe a patent or patent application that you own or control, you hereby commit to grant to all implementers of such Distribution or Future Specification an irrevocable, worldwide, sublicenseable, royalty free license under such patent or patent application to make, have made, use, sell, offer for sale, import and export products or services that implement such Distribution or Future Specification. You warrant that (a) to the best of your knowledge you have the right to provide this Feedback, and if you are providing Feedback on behalf of a company, you have the rights to provide Feedback on behalf of your company; (b) the Feedback is not confidential to you and does not violate the copyright or trade secret interests of another; and (c) to the best of your knowledge, use of the Feedback would not cause an implementation of the Distribution or a Future Specification to necessarily infringe any third-party patent or patent application known to you. You also acknowledge that the OSGi Alliance is not required to incorporate your Feedback into any version of the Distribution or a Future Specification.

I HEREBY ACKNOWLEDGE AND AGREE TO THE TERMS AND CONDITIONS DELINEATED ABOVE.

Draft

Revision	Date	Comments
<u>Update</u>	12 Dec 2019	Thomas Watson, Edits after CPEG meeting
		FrameworkFactory is no longer modified, created     ConnectFrameworkFactory and renamed ConnectFactory to     ConnectFramework
		Updated methods where possible to allow the chain patterns
		Modified getModule to throw a BundleException directly
		<ul> <li>Clarify that ConnectContent getHeaders returns the raw unlocalized headers.</li> </ul>
		<ul> <li>Mandate that BundleWiring.getClassLoader always returns a BundleReference implementation for connect bundles</li> </ul>
		Added tags attribute to osgi.identity namespace to tag connect bundles at runtime

# 1 Introduction

This RFC discusses the need for an OSGi Framework that can integrate externally defined modules which are outside of the control of the framework. In other words, to connect the OSGi Framework to code and services from the outside world like jars on the class path or the Java Platform Module System (JPMS) module path.

Parts of this work were first explored in RFP-143 OSGiConnect. Although RFP-143 got accepted it never made it into an RFC. This RFC is taking the basic idea and generalizes it to allow for an adjusted set of use cases as well as focusing on a design that could possibly be driven by a launcher that uses a FrameworkFactory to create instances of a Framework that handle bundle content provided outside of the Framework.

December 16, 2019

# 2 Application Domain

The OSGi framework consists of a number of layers where the module layer is by far the largest and most complex. This layer has proved to be very useful for large and complex applications that require side by side versioning and encapsulation of their classes.

The OSGi module layer takes care of the class loading for each bundle and isolates bundles in their own class loader, minimizing global space. The consequence of the module layer being responsible for class loading, prevents or at least makes it very difficult to use classes or services that are already present on the class path and whose class space is managed outside of OSGi.

At the same time, functionality running outside of OSGi is not easily able to benefit from the rich service model of OSGi in a standardized way.

Finally, the OSGi framework assumes it is in control of the actual deployment units i.e., the jar files that get installed as Bundles. There is no way to represent outside content as bundles where the framework hasn't been given the deployment unit.

## 2.1 Terminology + Abbreviations

OSGi Connect - Working name given to this effort.

Connect Content – Provides a Framework access to content from outside the Framework that can be used to represent an installed bundle in the Framework. A connect content provides things like the class loader for the bundle, access to entries in a bundle (e.g. reading service component XML), and the bundle manifest headers. A bundle representing connect content might have some limitations with respect to class loading and isolation.

Connect Module – Provides the current connect content available for a bundle installed or updated in the Framework. If the connect content for a bundle is constant then the connect module may return the same connect content instance for the lifetime of the Framework.

Connect FactoryFramework — Hooks into the initialization of the OSGI Framework and provides a lookup of connect module instances for bundles installed in the Framework. TODO — I don't prefer the Factory term here because this is more about looking up existing Connect Module instances than creating new ones. Maybe rename to ConnectModules (plural)?

<u>Connect Framework Factory – A factory similar to the launch FrameworkFactory that is used to create OSGi Framework instances that use a Connect Factory</u>

Connect Bundle – A bundle installed in the Framework that has its content being provided by a Connect Content.

# 3 Problem Description

Code running outside of the OSGi framework is hard to use from the inside. The framework can delegate some of it via the system bundle exports but for "normal" Java applications that is often not enough and somewhat tedious in any case as the delegation is rather static. Furthermore, it isn't possible to represent logical units on the outside (like JPMS Modules, OSGi bundles on the classpath, or other components) inside the framework (as the only delegation method is packages exposed via the system bundle).

That makes it hard and in some cases impossible to create hybrid solutions that can be used inside OSGi as well as in other contexts and that would still work if the two are used within the same application. In other words, there is a need for a solution that allows to bridge part of the outside world into the OSGi framework in such a way that normal OSGi mechanisms apply to it.

# 4 Requirements

#### 4.1 Basic

- BA0010 It must be possible to install Connect Bundles.
- BA0020 It must be possible for Connect bundles to participate in the Service Layer as usual for Bundles.
- BA0030 It must be possible to use OSGi services implementing an API provided by a Connect Bundle outside of the OSGi framework.

### 4.2 Connect Bundle

- CB0010 It must be possible to provide the class loader for a connect bundle.
- CB0020 It must be possible to influence the wiring of a connect bundle similar to existing resolver hooks.
- CB0030 It must be possible to provide the manifest headers of a connect bundle.
- CB0040 It must be possible to provide the resources/entries of a connect bundle.
- CB0050 Connect bundles must be treated and behave like any other bundle except for a limited set of functionalities that are explicitly not supported.
- CB0060 Connect Bundles must be subject to the standard OSGi resolution rules.

December 16, 2019

Draft

- CB0070 All existing lifecycle methods must be well-defined wrt. Connect Bundles.
- CB0080 Installed Connect Bundles must be able to be persisted across restarts.

# 5 Technical Solution

A new package org.osgi.framework.connect is defined that has the Connect API. The <a href="mailto:oogi.framework.connect.ConnectFrameworkFactoryrg.osgi.framework.launch.Framework.launch.FrameworkFactoryrg.osgi.framework.launch.Framework.launch.frame

This method will create a new Framework instance that uses the specified ConnectFactoryFramework. Throws UnsupportedOperationException if the framework does not support connect.

Alternative suggestion to have a ConnectFrameworkFactory that extends FrameworkFactory. [PREFERRED approach]

## 5.1 Storage

If the framework supports persistence then the framework determines the path used for the storage area according to the launch property org.osgi.framework.storage. Once the framework instance has determined the storage area it must call the ConnectFactory method:

void ConnectFactory initialize(File storage, Map<String,String>
configuration);

TODO: SHOULD Path be used here? Or String that the value of storage property? File seems flexible enough.

The storage File is the storage area used by the Framework and may be null if persistence is not supported. The config Map is the unmodifiable map of framework configuration properties that were used to create the new Framework instance.

The ConnectFactory initialize method is called once for the life time of the framework instance and it must be called before any other method on the ConnectFactory. If the framework instance is stopped and started again the ConnectFactory initialize method is not called again because it is not possible to change the storage or the configuration without constructing a new framework instance.

#### 5.2 Activation

A ConnectFactory may hook into the lifecycle of the framework itself. This is done by the ConnectFactory providing a BundleActivator instance.

#### 5.2.1 Start

When the framework is initialized the system bundle enters the STARTING state. At this point a valid BundleContext exists for the framework. Before calling any extension bundle activator start methods the framework must call the ConnectFactory method:

## Optional<BundleActivator> createBundleActivator();

If the ConnectFactory provides a bundle activator then its start method must be called before any extension bundle activator start methods are called and before returning from Framework.init method.

The activator allows for the <code>ConnectFactory</code> hook into the lifecycle of the framework itself. For example, this allows the <code>ConnectFactory</code> to register services, add listeners, install other bundles etc. before other bundles installed in the framework do, including framework extension bundles. This is important to allow for a <code>ConnectFactory</code> to influence behavior of the framework by registering various framework hooks like a <code>org.osgi.framework.hooks.resolver.ResolverHook</code>. A <code>ResolverHook</code> is useful for cases where it does not make sense to allow the wiring of a connect bundle to to wire to capabilities provided by a normal bundle installed in the framework. In that case the <code>ConnectFactory</code> can register a <code>ResolverHook</code> to limit what a connect bundle wiring gets wired to.

### 5.3 Shutdown

When the framework is stopped it eventually reaches start level 0 and the framework checks to see if there are any framework extension activators to call the stop method on. After calling stop on framework extension activators the framework must call stop on the activator provided by the ConnectFactory at framework initialization.

### 5.4 Connect Content Install

When a bundle is installed a bundle location and optionally an input stream to the content is provided to the framework. Before the framework reads the content of the bundle, the framework must call the ConnectFactory method:

Optional<ConnectModule> getModule(String location) throws BundleException;

### TODO: throw BundleException instead?

The <code>getModule</code> method is given the bundle location used to install the bundle. The <code>getModule</code> method must do one of the following:

- 1. Throw an <a href="mailto:the-all-stateException">tlegalStateException</a> BundleException is thrown from install with the cause of the <a href="mailto:the-all-stateException">thrown</a> is thrown from install with the cause of the <a href="mailto:the-all-stateException">thrown</a> by the <a href="mailto:getModule">getModule</a> method must also result in a <a href="mailto:BundleException">BundleException</a>. must propagate to the caller of install.
- 2. Return an empty Optional indicating that the Framework must handle reading the content of the bundle itself.

Draft December 16, 2019

3. Return a present Optional indicating that the ConnectModule present must be used to access the content of the bundle.

If a ConnectModule is found for the bundle location then the following method is called by the Framework to get the current ConnectContent for the bundle:

### ConnectContent getContent() throws IOException;

If an IOException is thrown it must result in a BundleException with the thrown IOException as the cause. Any other unchecked exception thrown by the getContent method must also result in a BundleException.

The ConnectContent is then used by the framework to access content of the bundle's current BundleRevision.

## 5.5 Connect Content Update

If one of the <code>Bundle.update</code> methods is called for a bundle that has a <code>ConnectModule</code> present for the bundle location then the <code>ConnectModule.getContent</code> method must be called to get the current <code>ConnectContent</code> for the bundle. A <code>ConnectModule</code> is allowed to return the same <code>ConnectContent</code> or a different one each time <code>getContent</code> is called.

If an IOException is thrown it must result in a BundleException with the thrown IOException as the cause. Any other unchecked exception thrown by the getContent method must also result in a BundleException.

The ConnectContent is then used by the framework to access content of the bundle's current BundleRevision after the bundle update.

## 5.6 Reading Connect Content

The ConnectContent provides the framework with all the information and resources necessary to represent a BundleRevision in the framework.

### **5.6.1 Opening Connect Content**

Before accessing the ConnectContent a framework must first open the ConnectContent with the following method:

## void ConnectContent open() throws IOException;

TODO: SHOULD this be chainable and return ConnectContent

If an IOException is thrown while opening the content during install or update then it must result in a <code>BundleException</code> with the thrown <code>IOException</code> as the cause. A framework may open and close the content many times while the bundle is installed in the framework. For example, to limit the number of resources kept open concurrently by the framework. The framework must always ensure that the <code>ConnectContent</code> is open before calling other methods on the <code>ConnectContent</code>.

#### 5.6.2 Bundle Manifest Headers

A ConnectContent may provide the bundle manifest headers to be used for the bundle. The framework must call the following method:

Optional<Map<String,String>> getHeaders();

Connect Page 11 of 33

Draft December 16, 2019

If an empty Optional is returned then the framework must parse the bundle manifest itself by accessing the META-INF/MANIFEST.MF entry of the ConnectContent.

If the Optional returned has a Map present then the Map must be used to provide the raw unlocalized headers for the bundle headers. The headers must be used the same way the raw header values would have been used from a parsed META-INF/MANIFEST.MF entry. That is the header keys and values that have semantic meaning must be used by the framework for the bundle and the key/value pairs must be used for the Dictionary returned by Bundle.getHeaders methods. The BundleRevision associated with the ConnectContent must also have its capabilities and requirements defined by the contents of the Map.

TODO clarify that this is the raw headers unlocalized headers.

#### 5.6.3 Bundle Class Loader

A ConnectContent may provide the class loader to use for a bundle. Before creating a class loader for a bundle using a ConnectContent the framework must call the following method:

## Optional<ClassLoader> getClassLoader();

If an empty <code>Optional</code> is returned then the framework must create a class loader for the bundle. The class loader created by the framework must follow all the delegation rules defined by the OSGi module layer for a bundle class loader and it must implement the <code>BundleReference</code> interface. All resources found and classes defined by this class loader must have their content read using the <code>ConnectContent</code> entries. This is similar to how a bundle class loader works when the framework is responsible for ready bundle JAR files directly.

If the Optional returned has a ClassLoader present then that ClassLoader must be used foras the class loader offer the BundleWiring associated with the ConnectContent. The ClassLoader provided by the ConnectContent is not required to implement the BundleReference interface and is not required to follow the delegation rules defined by the OSGi module layer. If the ClassLoader does not implement BundleReference then the framework must wrap the ClassLoader with another ClassLoader that does implement BundleReference which returns the bundle associated with the BundleWiring from the getBundle method. This wrapper loader simply delegates all loading to the ClassLoader provided ConnectContent. A framework is free to always return a wrapper loader regardless of if the ConnectContent loader implements BundleReference or not.

TODO does that break the assumption that BundleWiring.getClassLoader object implements BundleReference?? Should the wiring return a wrapper that DOES implement BundleReference? Should we add a FrameworkUtil.getBundle(ClassLoader cl), try to stop developers from casting to BundleReference??

A ConnectFactory is not required to provide a unique class loader for each ConnectContent. That is the same class loader can be used as the class loader for multiple ConnectContent objects and therefore get used by multiple bundles installed in the framework. If the connect bundle exports packages then the ConnectContent class loader will be delegated to by other class loaders managed by the framework which do not have an associated ConnectContent. In other words, a bundle installed with no ConnectContent associated with it may import packages from connect bundles and the OSGi module layer will do the correct delegation of class loads to the connect class loader as defined by the OSGi module layer for exported packages.

#### 5.6.4 Connect Content Entries

A ConnectContent provides access to connect entries to be used by the framework for two purposes:

1. To provide content for the framework Bundle and BundleWiring methods which introspect bundle entries. For example, the Bundle.getEntry, Bundle.getEntryPaths and BundleWiring.findEntries methods.

Draft December 16, 2019

2. To provide content when the framework is responsible for creating the class loader for the module.

A resource in a ConnectContent is identified by a path name that is a '/'-separated path string. A ConnectContent may treat directories as resources, but it is not required to. Where a ConnectContent does contain a directory that can be located then its path name must end with a slash ('/'). The directory can also be located with a path name that drops the trailing slash.

### 5.6.4.1 Discover Connect Entry Names

All ConnectEntry names provided by a ConnectContent can be introspected by the ConnectContent method:

## Iterable<String> getEntries() throws IOException;

The iterable provided is used to by the framework for both the Bundle.getEntryPaths and BundleWiring.findEntries methods.

### 5.6.4.2 Connect Entry Lookup

The content of an entry contained in a ConnectContent can be introspected using the ConnectContent.ConnectEntry interface. A ConnectEntry can be found by its path name using the ConnectContent method:

### Optional<ConnectEntry> getEntry(String path);

An empty Optional is returned if the entry does not exist with the specified path name. Otherwise the present ConnectEntry is returned. The ConnectEntry can be used by the framework to create URLs with the framework specific protocol for bundle entries. For example, the URLs returned by the Bundle.getEntry and BundleWiring.findEntries methods.

The framework must ensure that the path value used does not start with slash ('/'). That is any paths used for Bundle.getEntry and BundleWiring.findEntries must have the beginning slash removed before calling ConnectContent.getEntry

#### **5.6.5 Closing Connect Content**

Once a BundleRevision which is backed by a ConnectContent is no longer in use by the framework then the framework must close the ConnectContent with the method:

## void ConnectContent close() throws IOException;

The framework is free to close the ConnectContent at any other time during the lifecycle of the framework, but it must always ensure ConnectContent is opened before calling other methods on it.

## 5.7 Launching From Persistent Storage

The framework must make a record of which bundles are installed using a <code>ConnectModule</code>. When the framework is stopped it must persist the state of all the installed bundles, including the ones using a <code>ConnectModule</code>. When a new framework instance is created using the persistent storage which recorded the use of a <code>ConnectModule</code>, the framework must verify that a <code>ConnectFactory</code> is available that can handle the bundle location.

If there is no ConnectModule present then the bundle installed must be discarded by the framework as if it is not installed and a warning framework event should be published or a warning should be logged.

The class FrameworkUtil has a number of static utility methods. The following method may be of interest to connect factory implementations:

```
public static Bundle getBundle(final Class<?> classFromBundle)
```

The classes from connect bundles, depending on if their class loader implements <code>BundleReference</code>, may return a <code>null</code> bundle from the <code>getBundle</code> method. To allow a connect factory implementation to hook into the <code>FrameworkUtil</code> class a new interface exists in the <code>org.osgi.framework.connect</code> package:

```
public interface FrameworkUtilHelper {
    default Optional<Bundle> getBundle(Class< ? > classFromBundle) {
        return null;
    }
}
```

The FrameworkUtil class has been enhanced to to get a list of available FrameworkUtilHelper implementations using the ServiceLoader. The FrameworkUtil.getBundle method has also been enhanced to fall back to using the available FrameworkUtilHelper implementations when the class loader of the classFromBundle is not a BundleReference.

The immutable list of available FrameworkUtilHelper is determined during class initialization of the FrameworkUtil class and cannot change during the lifetime of the FrameworkUtil class.

# 5.9 Connect Content Namespace Identify Connect Bundles

To allow the discovery and detection of connect bundles the <code>osgi.identity</code> namespace has a new attribute defined named <code>tags</code>. The <code>tags</code> attribute provides a versatile way to identify some aspect of a resource for any reason. The value of this attribute must be <code>List<String></code>. For connect bundles installed in the framework the value <code>osgi.connect</code> must be added to the list of tags for the <code>osgi.identity</code> capability. For all other bundles the framework is free to omit the <code>tags</code> attribute from the <code>osgi.identity</code> capability. TODO need a new namespace that gets used by the framework to add a new capability to bundle revisions that are backed by a connect content.

**Description** 

Interface Sum	Interface Summary	
ConnectConten t	A connect content provides a framework access to the content of a connect <u>module</u> .	17
ConnectConten t.ConnectEntry	Represents the entry of a connect module	20
ConnectFrame work	A connect framework provides access to instances of <a href="ConnectModule">ConnectModule</a> that are used by a org.osgi.framework.launch.Framework instance to provide content and classes for a bundle installed in the Framework.	22
ConnectFrame workFactory	A factory for creating org.osgi.framework.launch.Framework instances.	24
ConnectModule	A connect module instance is used by a framework to load content for a bundle revision installed in the framework.	26
FrameworkUtil Helper	A helper for the org.osgi.framework.FrameworkUtil class.	27

# Package org.osgi.framework.connect Description

Framework Connect Package Version 1.0.

Bundles wishing to use this package must list the package in the Import-Package header of the bundle's manifest.

Example import for consumers using the API in this package:

Import-Package: org.osgi.framework.connect; version="[1.0,2.0)"

## **Interface ConnectContent**

org.osgi.framework.connect

public interface ConnectContent

A connect content provides a framework access to the content of a connect module. A framework may open and close the content for a connect module multiple times while the connect content is in use by the framework instance. The framework must close the connect content once the connect content is no longer used as the content of a current bundle revision or an in use bundle revision.

## **Field Detail**

## TAG\_OSGI\_CONNECT

public static final String TAG\_OSGI\_CONNECT = "osgi.connect"

The osgi.identity tags attribute value used by the framework to tag connect bundle revisions.

#### **Method Detail**

#### getHeaders

Optional<Map<String,String>> getHeaders()

Returns this connect content Manifest headers and values. The <code>empty</code> value is returned if the framework should handle parsing the Manifest of the content itself.

#### Returns:

This connect content Manifest headers and values.

#### Throws:

IllegalStateException - if the connect content has been closed

#### getEntries

Returns an iterable with all the entry names available in this ConnectContent

#### Returns:

the entry names

#### Throws:

IOException - if an error occurs reading the ConnectContent IllegalStateException - if the connect content has been closed

## getEntry

Optional<<u>ConnectContent.ConnectEntry</u>> getEntry(String path)

Returns the connect entry for the specified path name in this content. The <code>empty</code> value is returned if an entry with the specified path name does not exist. The path must not start with a "/" and is relative to the root of this content.

### Parameters:

path - the path name of the entry

#### Returns:

the connect entry, or empty if not found.

#### Throws:

 ${\tt IllegalStateException} \textbf{-if the connect content has been closed}$ 

## getClassLoader

```
Optional<ClassLoader> getClassLoader()
```

Returns a class loader for this connect content. The <code>empty</code> value is returned if the framework should handle creating a class loader for the bundle revision associated with this connect content.

This method is called by the framework for resolved bundles only and will be called at most once while a bundle is resolved. If a bundle associated with a connect module is refreshed and resolved again the framework will ask the content for the class loader again. This allows for a connect content to reuse or create a new class loader each time the bundle revision is resolved.

#### Returns:

a class loader for the module.

### open

Opens this connect content. The framework will open the content when it needs to access the content for a bundle revision associated with the connect content. The framework may lazily open the content until the first request is made to access the bundle revision content.

Returns:

a reference to this object

Throws:

IOException - if an error occurred opening the content

## close

Closes this connect content.

Returns:

a reference to this object

Throws:

IOException - if an error occurred closing the connect content

# Interface ConnectContent.ConnectEntry

org.osgi.framework.connect

### **Enclosing class:**

**ConnectContent** 

public static interface ConnectContent.ConnectEntry

Represents the entry of a connect module

Method	Method Summary	
byte[]	getBytes ()  Returns the content of the entry as a byte array.	21
long	getContentLength() Returns the size of the entry.	20
InputStrea m	getInputStream() Returns the content of the entry as an input stream.	21
long	getLastModified()  Returns the last modification time of the entry	20
String	getName ()  Returns the path name of the entry	20

## **Method Detail**

## getName

String getName()

Returns the path name of the entry

#### Returns:

the path name of the entry

## getContentLength

long getContentLength()

Returns the size of the entry. The value -1 is returned if the content length is not known.

#### Returns:

the size of the entry, or -1 if the content length is not known.

## getLastModified

long getLastModified()

Returns the last modification time of the entry

#### Returns:

the last modification time of the entry

## getBytes

Returns the content of the entry as a byte array.

Returns:

the content bytes

Throws:

IOException - if an error occurs reading the content

## getInputStream

Returns the content of the entry as an input stream.

Returns:

the content input stream

Throws:

IOException - if an error occurs reading the content

## Interface ConnectFramework

#### org.osgi.framework.connect

public interface ConnectFramework

A connect framework provides access to instances of <a href="ConnectModule">ConnectModule</a> that are used by a org.osgi.framework.launch.Framework instance to provide content and classes for a bundle installed in the Framework. A connect framework is provided when <a href="Creating">Creating</a> a framework instance. Because a connect framework instance can participate in the initialization of the framework and the life cycle of a framework instance the connect framework instance should only be used with a single framework instance.

#### **ThreadSafe**

Method	Method Summary	
Optional <ord> rg.osgi.fr  amework.Bu  ndleActiva  tor&gt;</ord>	<u>createBundleActivator</u> ()  Creates a new activator for this connect framework.	23
Optional< <u>C</u> onnectModu le>	<pre>getModule (String location) Returns the connect module for the specified bundle location.</pre>	22
ConnectFra mework	<pre>initialize(File storage, Map<string,string> configuration)</string,string></pre>	22

### **Method Detail**

#### initialize

Initializes the connect framework with the framework persistent storage file and framework properties configured for a org.osgi.framework.launch.Framework instance. This method is called once by a org.osgi.framework.launch.Framework instance and is called before any other methods on this connect framework are called.

#### Parameters:

storage - the persistent storage area used by the org.osgi.framework.launch.Framework or null if the if the platform does not have file system support.

configuration - The framework properties to used configure the new framework instance. An unmodifiable map of framework configuration properties that were used to create a new framework instance.

#### Returns:

a reference to this object

## getModule

```
Optional<<u>ConnectModule</u>> getModule(String location) throws org.osgi.framework.BundleException
```

Returns the connect module for the specified bundle location. If an empty optional is returned the the framework must handle reading the content of the bundle itself. If a value is present in the returned optional then the value from the optional must be used to access the content of the bundle.

#### Parameters:

location - the bundle location used to install a bundle

#### Returns:

the connect module for the specified bundle location

### Throws:

org.osgi.framework.BundleException - if the location cannot be handled

#### createBundleActivator

Optional<org.osgi.framework.BundleActivator> createBundleActivator()

Creates a new activator for this connect framework. A new activator is created by the framework each time the framework is <code>initialized</code>. An activator allows the connect framework to participate in the framework life cyle. When the framework is <code>initialized</code> the activator <code>start</code> method is called. When the framework is <code>stopped</code> the activator <code>stop</code> method is called

#### Returns:

a new activator for this connect framework or empty if no activator is available

## Interface ConnectFrameworkFactory

#### org.osgi.framework.connect

@org.osgi.annotation.versioning.ProviderType
public interface ConnectFrameworkFactory

A factory for creating org.osgi.framework.launch.Framework instances.

If a framework supports ConnectFramework then the implementation jar must contain the following resource:

/META-INF/services/org.osgi.framework.connect.ConnectFrameworkFactory

This UTF-8 encoded resource must contain the name of the framework implementation's ConnectFrameworkFactory implementation class. Space and tab characters, including blank lines, in the resource must be ignored. The number sign ('#' \u0023) and all characters following it on each line are a comment and must be ignored.

Launchers can find the name of the ConnectFrameworkFactory implementation class in the resource and then load and construct a ConnectFrameworkFactory object for the framework implementation. The ConnectFrameworkFactory implementation class must have a public, no-argument constructor. Java $^{\text{TM}}$  SE 6 introduced the ServiceLoader class which can create a ConnectFrameworkFactory instance from the resource.

#### **ThreadSafe**

Method	Summary	Pag e
org.osgi.f ramework.l aunch.Fram ework	connectFramework)	24

### **Method Detail**

#### newFramework

Create a new org.osgi.framework.launch.Framework instance using the specified connect framework.

#### Parameters:

configuration - The framework properties to configure the new framework instance. If framework properties are not provided by the configuration argument, the created framework instance must use some reasonable default configuration appropriate for the current VM. For example, the system packages for the current execution environment should be properly exported. The specified configuration argument may be <code>null</code>. The created framework instance must copy any information needed from the specified configuration argument since the configuration argument can be changed after the framework instance has been created.

connectFramework - The connect framework that the new framework instance will use. The specified connect framework argument may be null.

#### Returns:

A new, configured org.osgi.framework.launch.Framework instance. The framework instance must be in the org.osgi.framework.Bundle.INSTALLED state.

#### Throws:

SecurityException - If the caller does not have AllPermission, and the Java Runtime Environment supports permissions.

Since:

1.3

 $\underline{\texttt{ConnectFramework}}$ 

## Interface ConnectModule

### org.osgi.framework.connect

public interface ConnectModule

A connect module instance is used by a framework to load content for a bundle revision installed in the framework.

#### **ThreadSafe**

Method	Summary	Pag e
ConnectCo ten	Returns the current content of this connect module.	26

## **Method Detail**

## getContent

Returns the current content of this connect module. The framework will get the content when it needs to access the content for the current <code>bundle revision</code> associated with this connect module. The framework may lazily open the content until the first request is made to access the bundle content.

#### Returns:

the current content of this connect module

#### Throws:

IOException - if an error occurred getting the content

# Interface FrameworkUtilHelper

### org.osgi.framework.connect

public interface FrameworkUtilHelper

A helper for the <code>org.osgi.framework.FrameworkUtil</code> class. This helper provides alternative implementations for methods on <code>org.osgi.framework.FrameworkUtil</code>.

Method	Summary	Pag e
Optional <or></or> rg.osgi.fr	<pre>getBundle (Class<?> classFromBundle)</pre>	27
amework.Bu ndle>	· · · · · · · · · · · · · · · · · · ·	"

## **Method Detail**

### getBundle

Optional<org.osgi.framework.Bundle> **getBundle**(Class<?> classFromBundle)

Return a Bundle associated with the specified class.

This helper method is called by org.osgi.framework.FrameworkUtil.getBundle(Class) if the standard implementation of FrameworkUtil cannot find the bundle.

#### Parameters:

 ${\tt classFromBundle} \textbf{ - A class associated with a bundle}$ 

#### Returns:

An Optional containing a Bundle for the specified class or an empty Optional if the specified class is not from a bundle.

# Package org.osgi.framework.namespace

@org.osgi.annotation.versioning.Version(value="1.2")

Namespace Package Version 1.2.

See:

**Description** 

Class Summary		Page	
IdentityNames pace	Identity Capability and Requirement Namespace.	29	

# Package org.osgi.framework.namespace Description

Namespace Package Version 1.2.

Bundles should not need to import this package at runtime since all the types in this package just contain constants for capability and requirement namespaces specified by the OSGi Alliance.

## **Class IdentityNamespace**

org.osgi.framework.namespace

```
java.lang.Object
Lorg.osgi.resource.Namespace
Lorg.osgi.framework.namespace.IdentityNamespace
```

```
final public class IdentityNamespace
extends org.osgi.resource.Namespace
```

Identity Capability and Requirement Namespace.

This class defines the names for the attributes and directives for this namespace. All unspecified capability attributes are of type <code>string</code> and are used as arbitrary matching attributes for the capability. The values associated with the specified directive and attribute keys are of type <code>string</code>, unless otherwise indicated.

Each resource provides exactly one<sup>†</sup> identity capability that can be used to identify the resource.

The bundle wiring for the bundle revision provides exactly one<sup>†</sup> identity capability.

† A resource with no symbolic name must not provide an identity capability.

#### **Immutable**

eld Summary		Pa:
static String	CAPABILITY_COPYRIGHT_ATTRIBUTE  The capability attribute that contains a human readable copyright notice for the resource.	31
static String	CAPABILITY_DESCRIPTION_ATTRIBUTE  The capability attribute that contains a human readable description for the resource.	3.
static String	CAPABILITY_DOCUMENTATION_ATTRIBUTE  The capability attribute that contains the URL to documentation for the resource.	3
static String	CAPABILITY_LICENSE_ATTRIBUTE  The capability attribute that contains the URL to the license for the resource.	3
static String	CAPABILITY_SINGLETON_DIRECTIVE  The capability directive identifying if the resource is a singleton.	3
static String	CAPABILITY_TAGS_ATTRIBUTE  The attribute value that contains tags for the resource.	3
static String	CAPABILITY_TYPE_ATTRIBUTE  The capability attribute identifying the resource type.	3
static String	CAPABILITY_VERSION_ATTRIBUTE  The capability attribute identifying the Version of the resource if one is specified or 0.0.0 if not specified.	3
static String	CLASSIFIER_JAVADOC  The attribute value identifying the resource <u>classifier</u> as an archive containing the javadoc in the same directory layout as the resource.	3
static String	CLASSIFIER_SOURCES  The attribute value identifying the resource <a href="classifier">classifier</a> as an archive containing the source code in the same directory layout as the resource.	3

static String	TYPE_FRAGMENT	31
Sering	The attribute value identifying the resource <u>type</u> as an OSGi fragment.	31
static String	TYPE_UNKNOWN	31
String	The attribute value identifying the resource <u>type</u> as unknown.	31

#### Fields inherited from class org.osgi.resource.Namespace

CAPABILITY\_EFFECTIVE\_DIRECTIVE, CAPABILITY\_USES\_DIRECTIVE, CARDINALITY\_MULTIPLE, CARDINALITY\_SINGLE, EFFECTIVE\_ACTIVE, EFFECTIVE\_RESOLVE, REQUIREMENT\_CARDINALITY\_DIRECTIVE, REQUIREMENT\_EFFECTIVE\_DIRECTIVE, REQUIREMENT\_FILTER\_DIRECTIVE, REQUIREMENT\_RESOLUTION DIRECTIVE, RESOLUTION MANDATORY, RESOLUTION OPTIONAL

### **Field Detail**

### **IDENTITY NAMESPACE**

public static final String IDENTITY\_NAMESPACE = "osgi.identity"

Namespace name for identity capabilities and requirements.

Also, the capability attribute used to specify the symbolic name of the resource.

### **CAPABILITY SINGLETON DIRECTIVE**

```
public static final String CAPABILITY SINGLETON DIRECTIVE = "singleton"
```

The capability directive identifying if the resource is a singleton. A string value of "true" indicates the resource is a singleton; any other value or null indicates the resource is not a singleton.

#### **CAPABILITY\_VERSION\_ATTRIBUTE**

```
public static final String CAPABILITY VERSION ATTRIBUTE = "version"
```

The capability attribute identifying the <code>version</code> of the resource if one is specified or <code>0.0.0</code> if not specified. The value of this attribute must be of type <code>version</code>.

### **CAPABILITY TYPE ATTRIBUTE**

```
public static final String CAPABILITY_TYPE_ATTRIBUTE = "type"
```

The capability attribute identifying the resource type. If the resource has no type then the value <u>unknown</u> must be used for the attribute.

#### See Also:

TYPE\_BUNDLE, TYPE\_FRAGMENT, TYPE\_UNKNOWN

### TYPE BUNDLE

```
public static final String TYPE BUNDLE = "osgi.bundle"
```

The attribute value identifying the resource <u>type</u> as an OSGi bundle.

#### See Also:

CAPABILITY TYPE ATTRIBUTE

### TYPE\_FRAGMENT

```
public static final String TYPE_FRAGMENT = "osgi.fragment"
```

The attribute value identifying the resource type as an OSGi fragment.

#### See Also:

CAPABILITY TYPE ATTRIBUTE

### TYPE\_UNKNOWN

```
public static final String TYPE_UNKNOWN = "unknown"
```

The attribute value identifying the resource type as unknown.

#### See Also:

CAPABILITY TYPE ATTRIBUTE

## CAPABILITY\_TAGS\_ATTRIBUTE

```
public static final String CAPABILITY_TAGS_ATTRIBUTE = "tags"
```

The attribute value that contains tags for the resource. A tag is used to identify an aspect of the resource that is not otherwise expressed by the capabilities of the resource. The value of this attribute must be of type List<Version>.

#### Since:

1.2

## CAPABILITY\_COPYRIGHT\_ATTRIBUTE

```
public static final String CAPABILITY COPYRIGHT ATTRIBUTE = "copyright"
```

The capability attribute that contains a human readable copyright notice for the resource. See the Bundle-Copyright manifest header.

#### CAPABILITY\_DESCRIPTION\_ATTRIBUTE

```
public static final String CAPABILITY DESCRIPTION_ATTRIBUTE = "description"
```

The capability attribute that contains a human readable description for the resource. See the Bundle-Description manifest header.

## CAPABILITY\_DOCUMENTATION\_ATTRIBUTE

```
public static final String CAPABILITY DOCUMENTATION ATTRIBUTE = "documentation"
```

The capability attribute that contains the URL to documentation for the resource. See the Bundle-DocURL manifest header.

### **CAPABILITY\_LICENSE\_ATTRIBUTE**

```
public static final String CAPABILITY_LICENSE_ATTRIBUTE = "license"
```

The capability attribute that contains the URL to the license for the resource. See the <code>name</code> portion of the <code>Bundle-License</code> manifest header.

### REQUIREMENT\_CLASSIFIER\_DIRECTIVE

public static final String REQUIREMENT CLASSIFIER DIRECTIVE = "classifier"

The requirement directive that classifies the relationship with another resource.

#### See Also:

CLASSIFIER SOURCES, CLASSIFIER JAVADOC

## **CLASSIFIER\_SOURCES**

public static final String CLASSIFIER\_SOURCES = "sources"

The attribute value identifying the resource <u>classifier</u> as an archive containing the source code in the same directory layout as the resource.

#### See Also:

REQUIREMENT CLASSIFIER DIRECTIVE

## **CLASSIFIER\_JAVADOC**

public static final String CLASSIFIER\_JAVADOC = "javadoc"

The attribute value identifying the resource <u>classifier</u> as an archive containing the javadoc in the same directory layout as the resource.

#### See Also:

REQUIREMENT CLASSIFIER DIRECTIVE

Java API documentation generated with <a href="DocFlex/Doclet">DocFlex/Doclet</a> v1.5.6

DocFlex/Doclet is both a multi-format Javadoc doclet and a free edition of <a href="DocFlex/Javadoc">DocFlex/Javadoc</a>. If you need to customize your Javadoc without writing a full-blown doclet from scratch, DocFlex/Javadoc may be the only tool able to help you! Find out more at <a href="www.docflex.com">www.docflex.com</a>

# 8 Considered Alternatives

In the early days of the Connect concept the idea was to produce a trimmed down Framework implementation that only understood how to load static things from the class path. An implementation of this idea was done in the Apache Felix project called PojoSR.

This approach is not used because may require forking the framework implementation for each Connect scenario. A better option is to add standard SPI to launch a standard Framework which allows for the Connect scenarios to work with compliant Framework implementations without modifying the Framework implementation itself.

# 9 Security Considerations

Connect content is managed from outside the Framework. The class loader used to load classes may not be provided by the Framework itself. The protection domain used for the classes from connect content also may not be provided by the Framework. This limits the ability to assign permissions to the classes from the connect content.

TODO should we clarify the permission admin specification??

A Connect Factory is passed the bundle location of all bundles installed in the framework. The bundle location may contain sensitive. Any Connect Factory uses must be trusted to handle such information in a secure way.
