Service Layer API for oneM2M

Draft

85 Pages

Abstract

10 point Arial Centered.

oneM2M is standard organization and specifies middleware for IoT, called Common Services Entities (CSE). Application can access functionality in CSE with RESTful operations, which are Create, Retrieve, Update, Delete and Notify. oneM2M allows variety of communication methods, 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR). This RFC describes the way to provide high level API for oneM2M RESTful operations hiding the difference of variety of communication methods.

DISTRIBUTION AND FEEDBACK LICENSE, Version 2.0

The OSGi Alliance hereby grants you a limited copyright license to copy and display this document (the "Distribution") in any medium without fee or royalty. This Distribution license is exclusively for the purpose of reviewing and providing feedback to the OSGi Alliance. You agree not to modify the Distribution in any way and further agree to not participate in any way in the making of derivative works thereof, other than as a necessary result of reviewing and providing feedback to the Distribution. You also agree to cause this notice, along with the accompanying consent, to be included on all copies (or portions thereof) of the Distribution. The OSGi Alliance also grants you a perpetual, non-exclusive, worldwide, fully paid-up, royalty free, limited license (without the right to sublicense) under any applicable copyrights, to create and/or distribute an implementation of the Distribution that: (i) fully implements the Distribution including all its required interfaces and functionality; (ii) does not modify, subset, superset or otherwise extend the OSGi Name Space, or include any public or protected packages, classes, Java interfaces, fields or methods within the OSGi Name Space other than those required and authorized by the Distribution. An implementation that does not satisfy limitations (i)-(ii) is not considered an implementation of the Distribution, does not receive the benefits of this license, and must not be described as an implementation of the Distribution. "OSGi Name Space" shall mean the public class or interface declarations whose names begin with "org.osgi" or any recognized successors or replacements thereof. The OSGi Alliance expressly reserves all rights not granted pursuant to these limited copyright licenses including termination of the license at will at any time.

EXCEPT FOR THE LIMITED COPYRIGHT LICENSES GRANTED ABOVE, THE OSGi ALLIANCE DOES NOT GRANT, EITHER EXPRESSLY OR IMPLIEDLY, A LICENSE TO ANY INTELLECTUAL PROPERTY IT, OR ANY THIRD PARTIES, OWN OR CONTROL. Title to the copyright in the Distribution will at all times remain with the OSGi Alliance. The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted therein are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

THE DISTRIBUTION IS PROVIDED "AS IS," AND THE OSGi ALLIANCE (INCLUDING ANY THIRD PARTIES THAT HAVE CONTRIBUTED TO THE DISTRIBUTION) MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, OR TITLE; THAT THE CONTENTS OF THE DISTRIBUTION ARE SUITABLE FOR ANY PURPOSE; NOR THAT THE IMPLEMENTATION OF SUCH CONTENTS WILL NOT INFRINGE ANY THIRD PARTY PATENTS, COPYRIGHTS, TRADEMARKS OR OTHER RIGHTS.
NEITHER THE OSGi ALLIANCE NOR ANY THIRD PARTY WILL BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF OR RELATING TO ANY USE OR DISTRIBUTION OF THE DISTRIBUTION.

Implementation of certain elements of this Distribution may be subject to third party intellectual property rights, including without limitation, patent rights (such a third party may or may not be a member of the OSGi Alliance). The OSGi Alliance is not responsible and shall not be held responsible in any manner for identifying or failing to identify any or all such third party intellectual property rights.

The Distribution is a draft. As a result, the final product may change substantially by the time of final publication, and you are cautioned against relying on the content of this Distribution. You are encouraged to update any implementation of the Distribution if and when such Distribution becomes a final specification.

The OSGi Alliance is willing to receive input, suggestions and other feedback ("Feedback") on the Distribution. By providing such Feedback to the OSGi Alliance, you grant to the OSGi Alliance and all its Members a non-exclusive, non-transferable,

worldwide, perpetual, irrevocable, royalty-free copyright license to copy, publish, license, modify, sublicense or otherwise distribute and exploit your Feedback for any purpose. Likewise, if incorporation of your Feedback would cause an implementation of the Distribution, including as it may be modified, amended, or published at any point in the future ("Future Specification"), to necessarily infringe a patent or patent application that you own or control, you hereby commit to grant to all implementers of such Distribution or Future Specification an irrevocable, worldwide, sublicenseable, royalty free license under such patent or patent application to make, have made, use, sell, offer for sale, import and export products or services that implement such Distribution or Future Specification. You warrant that (a) to the best of your knowledge you have the right to provide this Feedback, and if you are providing Feedback on behalf of a company, you have the rights to provide Feedback on behalf of your company; (b) the Feedback is not confidential to you and does not violate the copyright or trade secret interests of another; and (c) to the best of your knowledge, use of the Feedback would not cause an implementation of the Distribution or a Future Specification to necessarily infringe any third-party patent or patent application known to you. You also acknowledge that the OSGi Alliance is not required to incorporate your Feedback into any version of the Distribution or a Future Specification.

I HEREBY ACKNOWLEDGE AND AGREE TO THE TERMS AND CONDITIONS DELINEATED ABOVE.

0.6 Revision History

The last named individual in this history is currently responsible for this document.

Revision	Date	Comments
Initial	*SEP 15 2017*	Initial Contribution. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp
0.0.1	*SEP 21 2017*	Updated alternatives, some figures, added description on validator. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp

Revision	Date	Comments
0.0.2	*April 17 2018*	Update based on discussion in Washington meeting. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp
0.0.3	*June 22 2018*	Add new fields and class reflecting R3 draft of oneM2M: Added fields in RequestPrimitiveDTO, ResponsePrimitiveDTO, and FilterCriteriaDTO, and ReleaseVersion enum. Organize DTOs: Added AttributeDTO, LocalIdTokenIdAssigmentDTO, and DasInfoDTO and remove DynAuthLocalIdAssignmentsDTO and DynAuthReqInfoDTO Introduce OperationIF interface as a super interface of ProtocolBinding interface and CSE interface for enabling concise application code. This replaces former simple.Client. Organize Introspection interfaces with less methods. They are moved to dedicated package.
0.0.4	*June 25 2018*	Add section 'Mapping Rules for Generic DTO' Update Javadoc with more explanations. (moved old classes to org.osgi.service.onem2m.old package for preparing deletion.) Add description to Security Consideration section. Add oneM2M R3 specs and XSD to references.
0.0.5	*Jun 27 2018*	Modified after discussion in Washington DC F2F. Restructure service interfaces; now 2 interface is remaining. For receiving notification, dedicated interface is prepared. Remove Introspection interfaces. Reduce service properties by removing ones for informative purpose. Add example flow to control devices. Modify security consideration in section 9.2.

1   Introduction

Introduce the RFC. Discuss the origins and status of the RFC and list any open items to do.

oneM2M is standard organization and specifies middleware for Internet of Things (IoT), called Common Services Entities (CSE). Applications can access CSE's functionality with RESTful operations, which are Create, Retrieve, Update, Delete and Notify. TS-0001 [2] defines more than 40 resource types to expose CSE's functionalities. oneM2M allows variety of communication methods, combination of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR).

This RFP discuss the way to provide high level API (namely service layer API) for oneM2M RESTful operations hiding the difference of variety of communication methods.

2   Application Domain

This section should be copied from the appropriate RFP(s). It is repeated here so it can be extended while the RFC authors learn more subtle details.

2.1   IoT Application configuration using oneM2M

oneM2M's middleware, called CSE can be deployed in different locations and they are connected each other forming tree topology. Depending on deployed location, CSEs are categorized to 3 types, IN-CSE, MN-CSE and ASN-CSE. IN-CSE is located top of tree, ASN-CSE is located at leaf and MN-CSE is located and MN-CSE is located on middle.
oneM2M's application, called Application Entity (AE) connects to one of CSEs. After AE connecting to the CSE, AE can access to all of CSEs, by retargeting function (similar to routing) of CSEs.

AE accesses to CSE's functionality through RESTful API, which consists of Create, Retrieve, Update, Delete and Notify in targeting more than 40 types of resources. For examples, typical resources are <*contentInstance*> that expresses IoT data and <c*ontainer*> that holds set of <*contentInstance*>s. AE can create or retrieve the <contentInstance> on any CSE by the retargeting functionality, as far as permission is allowed. Interface between CSEs is called *mcc* and interface between CSE and AE is called *mc*a*,* both interfaces have almost same interface.

It is possible to develop variety types of distributed applications using the architecture. For example for IoT data aggregation applications, it is possible to develop gradual aggregation type or direct aggregation type. In gradual aggregation type, AE connected to ASN-CSE creates <*conentInstance*>s in ASN-CSE, and intermediate applications calculate statistics and put the result on IN-CSE as a <*contentInstance*>, while, in direct aggregation type, AE connected to ASN-CSE creates <*contentInstance*>s in IN-CSE directly.

Under CSE layer, oneM2M specifies NSE(Network Services Entity), but this RFC doesn't cover the NSE layer.
2.2   Communication methods used in oneM2M

oneM2M allows variety of communication methods, combination of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR). It might be added in future. oneM2M specifies specification in different level.
 Firstly TS-0001[2] specifies high level resource definitions, it defines more than 40 resource types, such as <contentInstance> for storing IoT data, <timeSeriesInstance> for periodic sensor measurement with leap detection mechanism.
 Secondly TS-0004[3] specifies procedures and serializations in independent manner from protocol bindings. Resource type and protocol data unit are defined using XSD for XML serialization. Mapping between XML and other serializations are also specified.
Thirdly TS-0008, TS-0009, TS-0010, TS-0020 specify protocol specific details for CoAP, HTTP, MQTT and Web Socket respectively.

2.3 Long name and short name

oneM2M introduced two types of notation, called long name and short name for resource types, attribute and so on. Long name is human friendly string and specifications mainly use this notation, while short name is short string consist of typically 2 or 3 characters (but not limited and sometimes longer) and communication protocol use this notation. In most cases, the initial characters of long name are assigned as short name, for examples, ct for CreationTime and at for AnnounceTo.

3   Problem Description

This section should be copied from the appropriate RFP(s). It is repeated here so it can be extended while the RFC authors learn more subtle details.

oneM2M specifies protocol based interface, but doesn't specify programing level API. As previously mentioned oneM2M allows variety of communication methods which are the combinations of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR).

First problem is application portability. Without standardized API, application program tends to depend on the communication method initially intend to use and it will became hard to run another environment in which uses another communication method. (For example, an application designed for XML/HTTP, tend to run on environment use JSON/Websocket)

Second problem is the latency of the communication between CSE and application. Even if CSE and application is located in the same box, current oneM2M specifications define methods through protocols which requires serialization/deserialization of data, context-switch of applications, validation of incoming data and resulted in large latency compared to the situation both CSE and Application resides in the same Java VM and communicate with Java interfaces. Large latency reduces applicable area of oneM2M based solution.

Third problem is the complexity of handling of long name and short name. Even if short name is defined by trying to use initial characters, it is not straight forward to translate them in head.

4   Requirements

This section should be copied from the appropriate RFP(s)

- R0010 – The solution MUST provide means to access outer CSE from application.

- R0011 – The solution MUST provide means to access outer CSE from client CSE.

- R0012 – The solution MUST provide means to select a communication method for application.

- R0013 – The solution MUST provide means to select a communication method for client CSE.

- R0020 – The solution MUST provide means for CSE to accept requests form outer CSE.

- R0020 – The solution MUST provide means for CSE to accept requests form outer application.

- R0030 – The solution MUST provide means to communicate through Java interface between CSE and application that are located in the same OSGi framework.

- R0040 – The solution SHOULD hide differences of communication methods, which are combinations of 4 protocol bindings and 3 serializations (XML, JSON, CBOR).

- R0050 – The solution SHOULD provide developer friendly way for handling short names.

- R0060 – The solution MUST provide asynchronous interface using 'call by value', such as DTO.

5 Technical Solution

First give an architectural overview of the solution so the reader is gently introduced in the solution (Javadoc is not considered gently). What are the different modules? How do the modules relate? How do they interact? Where do they come from? This section should contain a class diagram. Then describe the different modules in detail. This should contain descriptions, Java code, UML class diagrams, state diagrams and interaction diagrams. This section should be sufficient to implement the solution assuming a skilled person.

Strictly use the terminology a defined in the Problem Context.

On each level, list the limitations of the solutions and any rationales for design decisions. Almost every decision is a trade off so explain what those trade offs are and why a specific trade off is made.

Address what security mechanisms are implemented and how they should be used.

5.1 Overview for the solution

Protocol binding service is introduced to handle different protocols and serializations. oneM2M application uses the protocol binding service through Service Layer Interface to communicate CSE. The interface is protocol and serialization agnostic interface; it has no protocol and serialization specific methods, parameters, so that application can communicate to CSE without knowing which protocol is actually used.

AE
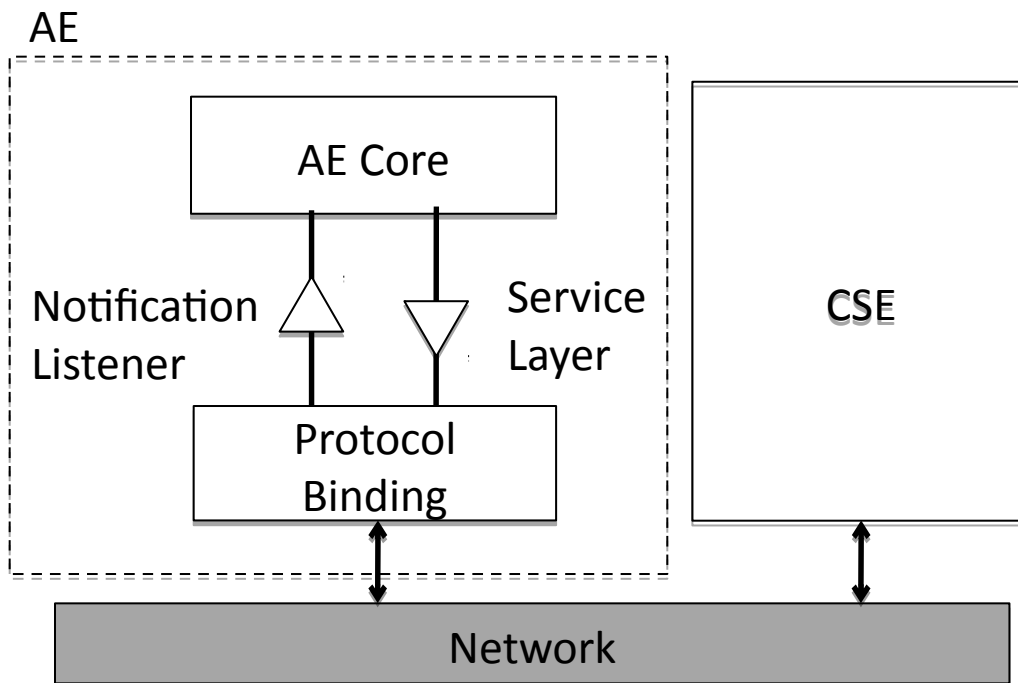

In figure, the term of Core is introduced for AE Core and CSE Core. This is for specifying parts which does not contain ProtocolBinding of AE and CSE.

Another use case is that the AE Core and the CSE core are located on the same OSGi Framework. In this use case, the AE Core and the CSE core communicate directly with ServiceLayer API, without inter-mediating ProtocolBinding Services. Following figure depicts overall configuration. Though this type of communication is not clearly defined in oneM2M specification, communicating directly without serializing data between AE and CSE allows shorter latency and less computational resources.
Following figure (right hand side) shows potential implementation of CSE, which are consisted fo CSE core and Protocol Binding Service, as symmetric to AE side. APIs defined in this RFC is consistent with the usage, but this RFC does not mandate that usage and it is left to implementor's choice.

5.2 Service Layer Interfaces

Service Layer Interface is for allowing AE to send request and get response.

request() method allows very raw data type access and it enables all possible message exchanges among oneM2M entities,

```
Promise<ResponseDTO> request(RequestDTO request);
```

Meanwhile, it can be redundant to application developers, because they need to write composition of requestPrimitive and decomposition of responsePrimitive. This interface is provided for application developer allowing less application codes. It provides methods with higher level of abstraction; operation level of resource such as create, retrieve, update, delete and so on. They do not cover all of possible message exchange but do typical ones.

Note: If this RFC doesn't provide these methods, developers likely to create similar ones in their own (various) way.

package org.osgi.service.onem2m.servicelayer;

```java
import org.osgi.onem2m.dto.RequestDTO;
import org.osgi.onem2m.dto.ResponseDTO;
import org.osgi.util.promise.Promise;

/**
 * Service Layer Interface, which locates between AE and Protocol Binding Service.
 */
public interface ServiceLayer {
    /**
     * send a request.
     *
     * @param request request
     * @return promise for ResponseDTO.
     */
    Promise<ResponseDTO> request(RequestDTO request);

    /**
     * create resource
     *
     * @param uri URI for parent resource
     * @param resource resource data
     * @return Promise of created resource
     */
    public Promise<ResourceDTO> create(String uri, ResourceDTO resource);

    /**
     * retrieve resource
     *
     * @param uri URI for retrieving resource
     * @return retrieved resource data
     */
    public Promise<ResourceDTO> retrieve(String uri, ResourceDTO resource);

    /**
     * retrieve subset of attributes.
     *
     * @param uri URI for retrieving resource
     * @param targetNames attribute names for retrival
     * @return retrieved resource data
     */
    public Promise<ResourceDTO> retrieve(String uri, List<String>
targetAttributes);

    /**
     * update resource
     *
     * @param uri URI for updating resource
     * @param resource data resource
```

```java
 * @return updated resource
 */
public Promise<ResourceDTO> update(String uri, ResourceDTO resource);

/**
 * delete resource
 *
 * @param uri target URI for deleting resource
 */
public Promise<Boolean> delete(String uri);

/**
 * find resources
 *
 * @param uri URI for top of search
 * @param fc filter criteria
 * @return list of URIs matching the condition specified in fc
 */
public Promise<List<String>> discovery(String uri, FilterCriteriaDTO fc);

/**
 * send notification
 *
 * @param notification
 */
public Promise<Boolean> notify(String uri, NotificationDTO notification );

}
```

5.3   Service Property for Interfaces

Services implementing Service Layer Interface shall be registered with following properties.

Interface	property Name	type	explanation
ServiceLayer	POAforAE	String[]	URIs for point of access. POA is basically set of listening protocol, host, port and subaddress or oneM2M address. In case that implementing entity is Protocol Binding, this property is provided, meanwhile, in case of CSE Core, the property is not provided. [MAY BE TRICKY]
NotificationListener	AE-ID	String	ID of Application Entity
	POA	String[]	Point of Access

Here, AE-ID of NotificationListener is assigned by CSE thorough registration process, which is done by creating AE resource. After receiving assigned value, AE Core should updated the property with the value.

POA is the URIs for receiving Notification. AE Core retrieves the value from property of using ServiceLayer. [MAY BE TRICKY: having getPOA() method in ServiceLayer is also alternative approach.]

NOTE: It may be informative to put information on service properties, such as protocol, serialization, usage of secure protocol, oneM2M release version, or CSEtype, but there is no clear use case to use them, This RFC does not specify their usage.

5.4   Service Binding

Proper Protocol Binding Service must be bound to proper AE Core. Implementation of ServiceLayer may be registered as ServiceFactory on the service registry and implementation should create a proper service instance depending on calling AE Core.

How to create and configure is out of scope of this RFC.

5.5   Example: Turning Light ON

Following figure shows the example showing how application turn on the light device on the remote.
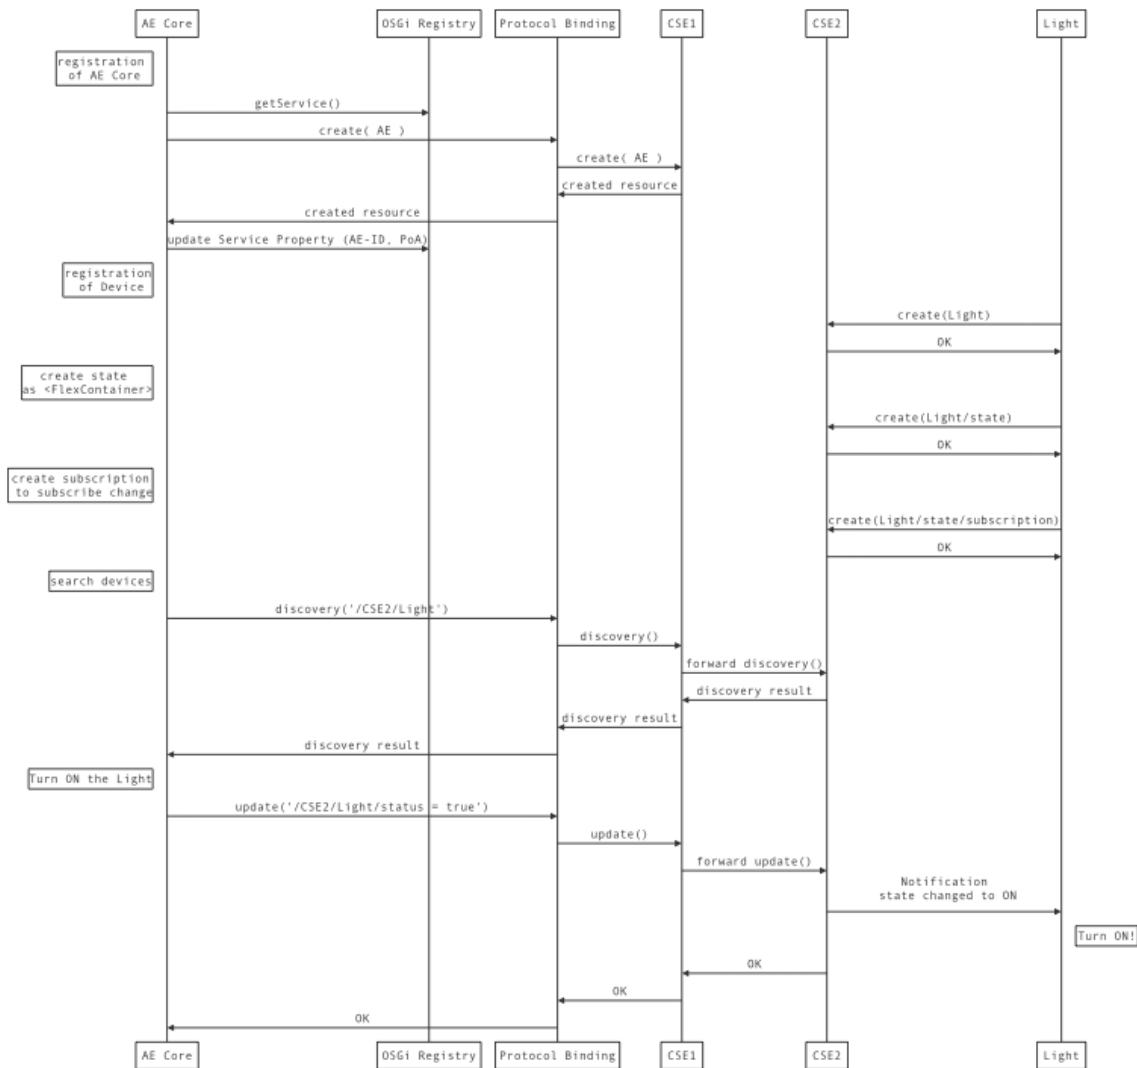

[This MAY BE SMALL TO READ: please refer sequence.png or sequence.md]

6 Data Transfer Objects

RFC 185 defines Data Transfer Objects as a generic means for management solutions to interact with runtime entities in an OSGi Framework. DTOs provides a common, easily serializable representation of the technology.

For all new functionality added to the OSGi Framework the question should be asked: would this feature benefit from a DTO? The expectation is that in most cases it would.

The DTOs for the design in this RFC should be described here and if there are no DTOs being defined an explanation should be given explaining why this is not applicable in this case.

This section is optional and could also be provided in a separate RFC.

6.1 Design Policy of DTOs

Data transfer Object was chosen as data object passing by the interfaces, following OSGi's design convention. Though data structure near root structures are designed specific DTO, deeper data types are to be stored as generic types, such as Map, List and Wrapper classes of Java Primitives. Following figure depict reference relationship among object. (See also the considered Alternatives)

In the class definition, some data types are shown as Object, but the assigned value shall be a type that is allowed for OSGi DTO.
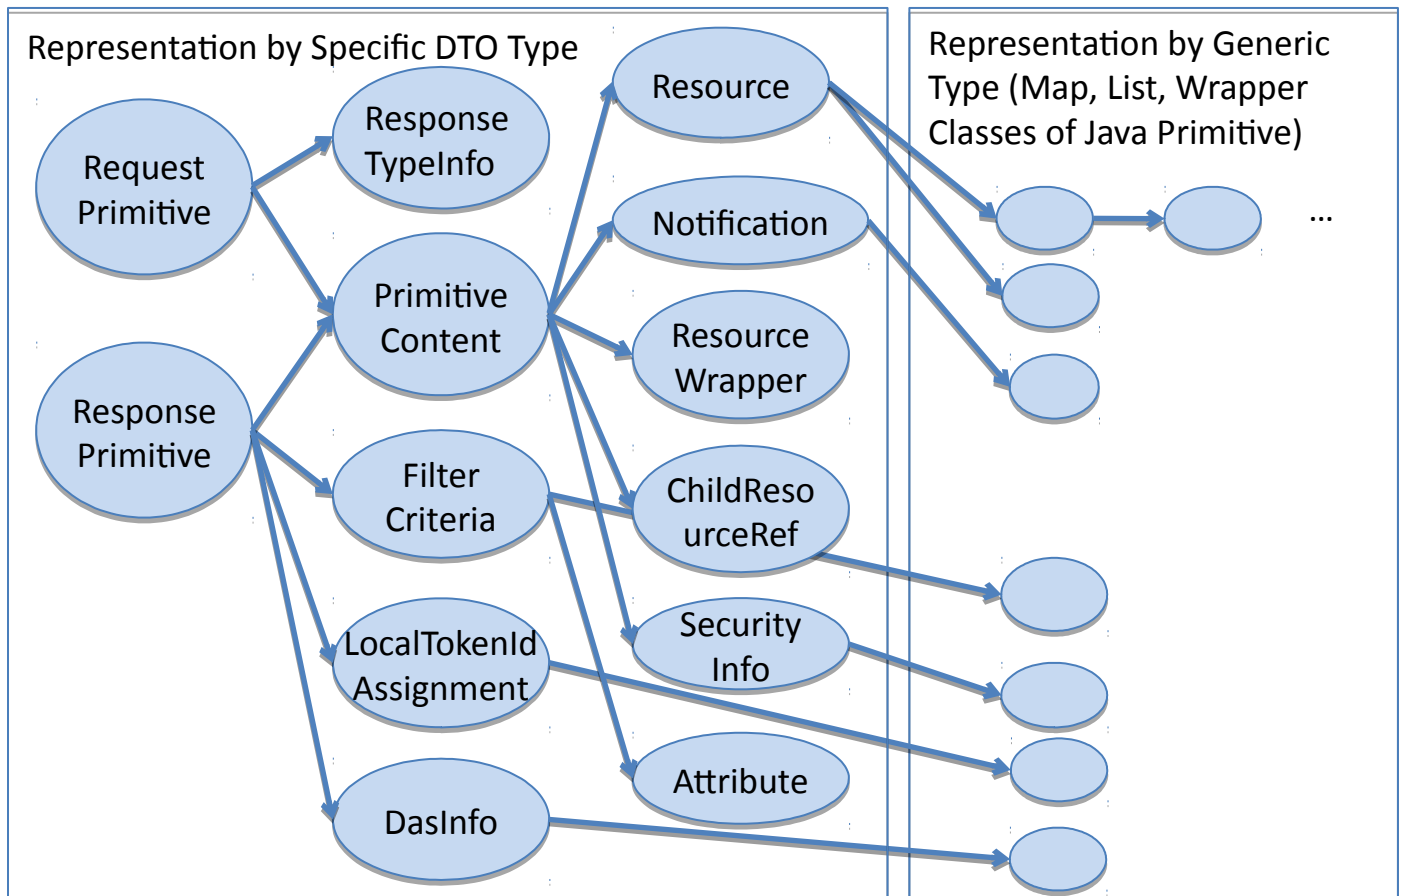

In figure, followed 'DTO' is ommited.

6.2 RequestPrimitiveDTO

RequestPrimitiveDTO holds a Request Information used for oneM2M communication.

```java
package org.osgi.service.onem2m.dto;

import java.util.*;

public class RequestPrimitiveDTO extends org.osgi.dto.DTO {
    @javax.xml.bind.annotation.XmlElement(required = true)
    public Operation operation;
    @javax.xml.bind.annotation.XmlElement(required = true)
    public String to;
    public String from;
    @javax.xml.bind.annotation.XmlElement(required = true)
    public String requestIdentifier;
    @javax.xml.bind.annotation.XmlElement(required = false)
    public Integer resourceType;
    public PrimitiveContentDTO content;
    public List<String> roleIDs;

    public String originatingTimestamp;
    public String requestExpirationTimestamp;
    public String resultExpirationTimestamp;
    public String operationExecutionTime;

    public ResponseTypeInfoDTO responseType;
    public String resultPersistence;
    @javax.xml.bind.annotation.XmlElement(required = false)
    public ResultContent resultContent;
    public String eventCategory;
    @javax.xml.bind.annotation.XmlElement(required = false)
    public Boolean deliveryAggregation;
    public String groupRequestIdentifier;
    public FilterCriteriaDTO filterCriteria;
    @javax.xml.bind.annotation.XmlElement(required = false)
    public DiscoveryResultType discoveryResultType;
    public String tokens;
    public List<String> tokenIDs;
    public List<String> localTokenIDs;
    @javax.xml.bind.annotation.XmlElement(required = false)
    public Boolean tokenReqIndicator;

    // Added at R3.0
    public List<String> groupRequestTargetMembers;
    public Boolean authSignatureIndicator;
```

```
        public List<String> authSignature;
        public Boolean authRelationshipIndicator;
        public Boolean semanticQueryIndicator;
        public ReleaseVersion releaseVersion;
        public String verndorInformation;

        public static enum DiscoveryResultType {
                structured(1), unstructured(2);
                // omitted
        }

        public static enum ResultContent {
                nothing(1), attributes(2), hierarchicalAddress(3),
                hierarchicalAddressAndAttributes(4),
attributesAndChildResources(5),
attributesAndChildResourceReferences(6),
childResourceReferences(7), originalResource(8), childResources(9);

                // omitted
        }

        public static enum Operation {
                Create(1), Retrieve(2), Update(3), Delete(4), Notify(5);
                // omitted
        }

}
```

6.3 ResponsePrimitiveDTO

ResponsePrimitiveDTO holds a Response Information used for oneM2M communication.

```
package org.osgi.service.onem2m.dto;
import java.util.*;

public class ResponsePrimitiveDTO extends org.osgi.dto.DTO{
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public Integer responseStatusCode;
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public String requestIdentifier;
        public PrimitiveContentDTO content;
        public String to;
        public String from;
        public String originatingTimestamp;
```

```java
        public String resultExpirationTimestamp;
        public String eventCategory;
        @javax.xml.bind.annotation.XmlElement( required  = false)
        public ContentStatus contentStatus;
        @javax.xml.bind.annotation.XmlElement( required  = false)
        public Integer contentOffset;
        public List<LocalTokenIdAssignmentDTO>
assignedTokenIdentifiers;//Map<String,Object>
        public List<DasInfoDTO> tokenReqInfo;//DynAuthTokenReqInfoDTO

        // Added R3.0
        public Boolean AuthSignatureReqInfo;
        public ReleaseVersion releaseVersionIndicator;
        public String vendorInformation;

        public static enum ContentStatus{
            PARTIAL_CONTENT, // 1
            FULL_CONTENT;   //2

        }
}
```

6.4   ResponseTypeInfoDTO

```java
package org.osgi.service.onem2m.dto;

import java.util.*;

public class ResponseTypeInfoDTO extends org.osgi.dto.DTO {
        @javax.xml.bind.annotation.XmlElement(required = true)
        public java.lang.Integer responseTypeValue;
        @javax.xml.bind.annotation.XmlElement(required = true)
        public List<java.lang.String> notificationURI;

        public static enum ResponseType {
            nonBlockingRequestSynch(1), nonBlockingRequestAsynch(2),
blockingRequest(3), flexBlocking(4);
            // omitted.
        }
}
```

6.5   FilterCriteriaDTO

```java
package org.osgi.service.onem2m.dto;
import java.util.*;

public class FilterCriteriaDTO extends org.osgi.dto.DTO{
      public String createdBefore;
      public String createdAfter;
      public String modifiedSince;
      public String unmodifiedSince;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer stateTagSmaller;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer stateTagBigger;
      public String expireBefore;
      public String expireAfter;
      public List<String> labels;
      public List<Integer> resourceType;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer sizeAbove;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer sizeBelow;
      public List<String> contentType;
      public AttributeDTO attribute;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public FilterUsage filterUsage;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer limit;
      public String semanticsFilter;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public FilterOperation filterOperation;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer contentFilterSyntax;
      public String contentFilterQuery;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer level;
      @javax.xml.bind.annotation.XmlElement( required  = false)
      public Integer offset;

      // added in R3
      public List<String> childLabels;
      public List<String> parentLabels;
      public String labelsQuery;
      public Integer childResourceType;
      public Integer parentResourceType;
      public AttributeDTO childAttribute;
      public AttributeDTO parentAttribute;
      public String applyRelativePath;
```

```java
public static enum FilterOperation {
        AND(1), OR(2);
        // omitted...
}

public static enum FilterUsage {
        DiscoveryCriteria(1), ConditionalRetrival(2), IPEOndemandDiscovery(3);
        // omitted...

    }
}
```

6.6 ResourceDTO

```java
package org.osgi.service.onem2m.dto;
import java.util.*;

public class ResourceDTO extends org.osgi.dto.DTO{

        // Universal Attribute, which can be held by all resources.
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public Integer resourceType;
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public String resourceID;
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public String parentID;
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public String creationTime;
        @javax.xml.bind.annotation.XmlElement( required  = true)
        public String lastModifiedTime;

        public String resourceName;

        // optional, Universal Attributes
        public List<String> labels;

        /**
         * Non Universal Attribute.
         * Value Part must be the types that are allowed for OSGi DTO.
         */
        public Map<String, Object> attribute;
}
```

6.7   NotificationDTO

NotificationDTO has information of notification.

```
package org.osgi.service.onem2m.dto;
import java.util.*;

public class NotificationDTO extends org.osgi.dto.DTO{
    public Map<String,Object> notificationEvent;//NotificationEventDTO
    @javax.xml.bind.annotation.XmlElement( required  = false)
    public Boolean verificationRequest;
    @javax.xml.bind.annotation.XmlElement( required  = false)
    public Boolean subscriptionDeletion;
    public String subscriptionReference;
    public String creator;
    public String notificationForwardingURI;
    @javax.xml.bind.annotation.XmlElement( required  = false)
    public Map<String,Object> ipeDiscoveryRequest;//IPEDiscoveryRequestDTO
}
```

6.8   Other DTOs

There are some other DTOs, please refer Javadoc section for them.

6.9   Mapping Rules for Generic DTO

Following table summarizes mapping rule between oneM2M data types and Generic types used in DTOs. There are two types of XSD are defined in oneM2M, which are longname version and shortname version. The longname version should be refered.

oneM2M Types (XML Schema)	Type of OSGi DTO	
Basic Types of XML Schema	Wrapper Object of Java primitive	For example: xs:integer, xs:float
xs:anyURI, m2m:ID,	String	
m2m:timestamp	String	YYYYMMDDThhmmss,ssssss
m2m:absRelTimestamp	String	Union of m2m:timestamp and xs:long. This is exception of union rule above. Distinction is done by existence of 'T'
xs:sequence (as complexType)	Map	Name of element is used for key of map.
xs:list, xs:sequence (as list)	List	
xs:union	Map	Base attribute of restriction tag is used for key of map. Only one key is allowed.

		See Example of missingDataList:

Following XML is an example of missingData.

```
<xs:simpleType name="missingDataList">

      <xs:union>

        <simpleType>

            <restriction base='m2m:listOfTimeStamp' />

        </simpleType>

        <simpleType>

            <restriction base='m2m:listOfRelTimeStamp' />

        </simpleType>

      </xs:union>

    </xs:simpleType>
```

7   Javadoc

Please include Javadoc of any new APIs here, once the design has matured. Instructions on how to export Javadoc for inclusion in the RFC can be found here: https://www.osgi.org/members/RFC/Javadoc

Package Summary		*Page*
org.osgi.service.onem2m	This package includes essential interfaces for oneM2M service layer API.	24
org.osgi.service.onem2m.dto	This package contains OSGi DTOs used in oneM2M Service Layer API.	30
org.osgi.service.onem2m.introspection	This package include interfaces for providing information of data structures and checking validity.	76

Package org.osgi.service.onem2m

This package includes essential interfaces for oneM2M service layer API.

See:
> *Description*

Interface Summary		*Page*
NotificationListener	Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.	26
ServiceLayer	Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.	27

Package org.osgi.service.onem2m Description

This package includes essential interfaces for oneM2M service layer API.

Interface NotificationListener

org.osgi.service.onem2m

---

public interface **NotificationListener**

Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.

Method Summary		*Page*
void	**notified**(RequestPrimitiveDTO request) receive notification.	26

Method Detail

notified

void **notified**(RequestPrimitiveDTO request)

receive notification.

Parameters:
request - request primitive

Interface ServiceLayer

org.osgi.service.onem2m

---

public interface **ServiceLayer**

Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.

Method Summary		Pag e
org.osgi.u til.promis e.Promise< ResourceDT O>	**create**(String uri, ResourceDTO resource) create resource	28
org.osgi.u til.promis e.Promise< Boolean>	**delete**(String uri) delete resource	29
org.osgi.u til.promis e.Promise< List<Strin g>>	**discovery**(String uri, FilterCriteriaDTO fc) find resources	29
org.osgi.u til.promis e.Promise< Boolean>	**notify**(String uri, NotificationDTO notification) send notification	29
org.osgi.u til.promis e.Promise< ResponsePr imitiveDTO >	**request**(RequestPrimitiveDTO request) send a request.	27
org.osgi.u til.promis e.Promise< ResourceDT O>	**retrieve**(String uri, List<String> targetAttributes) retrieve subset of attributes.	28
org.osgi.u til.promis e.Promise< ResourceDT O>	**retrieve**(String uri, ResourceDTO resource) retrieve resource	28
org.osgi.u til.promis e.Promise< ResourceDT O>	**update**(String uri, ResourceDTO resource) update resource	28

Method Detail

request
org.osgi.util.promise.Promise<ResponsePrimitiveDTO> **request**(RequestPrimitiveDTO request)

send a request.

Parameters:
        request - request primitive
Returns:
        promise of ResponseDTO.

---

create

```
org.osgi.util.promise.Promise<ResourceDTO> create(String uri,
                                                    ResourceDTO resource)
```

create resource

Parameters:
  `uri` - URI for parent resource
  `resource` - resource data
Returns:
  Promise of created resource

retrieve

```
org.osgi.util.promise.Promise<ResourceDTO> retrieve(String uri,
                                                      ResourceDTO resource)
```

retrieve resource

Parameters:
  `uri` - URI for retrieving resource
Returns:
  retrieved resource data

retrieve

```
org.osgi.util.promise.Promise<ResourceDTO> retrieve(String uri,
                                                      List<String> targetAttributes)
```

retrieve subset of attributes.

Parameters:
  `uri` - URI for retrieving resource
  `targetAttributes` - names of the target attribute
Returns:
  retrieved resource data

update

```
org.osgi.util.promise.Promise<ResourceDTO> update(String uri,
                                                    ResourceDTO resource)
```

update resource

Parameters:
  `uri` - URI for updating resource
  `resource` - data resource
Returns:
  updated resource

delete

```
org.osgi.util.promise.Promise<Boolean> delete(String uri)
```

>   delete resource
>
>   **Parameters:**
>   uri - target URI for deleting resource

discovery

```
org.osgi.util.promise.Promise<List<String>> discovery(String uri,
                                                       FilterCriteriaDTO fc)
```

>   find resources
>
>   **Parameters:**
>   uri - URI for top of search
>   fc - filter criteria
>   **Returns:**
>   list of URIs matching the condition specified in fc

notify

```
org.osgi.util.promise.Promise<Boolean> notify(String uri,
                                              NotificationDTO notification)
```

>   send notification

Package org.osgi.service.onem2m.dto

This package contains OSGi DTOs used in oneM2M Service Layer API.

See:
> *Description*

Class Summary		*Page*
AttributeDTO	DTO expresses Attribute.	32
ChildResourceRefDTO	DTO expressing ChildResourceRef.	33
DasInfoDTO	DTO expressing DasInfo.	35
FilterCriteriaDTO	DTO expressing FilterCriteria.	36
LocalTokenIdAssignmentDTO	DTO expressing LocalTokenIdAssignment.	45
NotificationDTO	DTO expressing Notification.	46
PrimitiveContentDTO	DTO expressing Primitive Content.	49
RequestPrimitiveDTO	DTO expresses Request Primitive.	52
ResourceDTO	DTO expressing Resource.	63
ResourceWrapperDTO	DTO expressing ResourceWrapper.	65
ResponsePrimitiveDTO	DTO expressing Response Primitive.	66
ResponseTypeInfoDTO	Expressing ResponseTypeInfo	71
SecurityInfoDTO	DTO expressing Security Info.	74

Enum Summary		*Page*
FilterCriteriaDTO.FilterOperation		41
FilterCriteriaDTO.FilterUsage		43
ReleaseVersion	Enum expressing oneM2M specification version.	50
RequestPrimitiveDTO.DiscoveryResultType		57
RequestPrimitiveDTO.Operation		59

RequestPrimiti veDTO.ResultC ontent		61
ResponsePrimi tiveDTO.Conte ntStatus		69
ResponseType InfoDTO.Respo nseType		72

Exception Summary	*Page*
OneM2MExcep tion General Exception for oneM2M.	48

Package org.osgi.service.onem2m.dto Description

This package contains OSGi DTOs used in oneM2M Service Layer API.

Class AttributeDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.AttributeDTO
```

```
public class AttributeDTO
extends org.osgi.dto.DTO
```

DTO expresses Attribute. This is typically used in FilterCriteriaDTO

Field Summary	Page
String **name**	32
Object **value**	32

Constructor Summary	Page
AttributeDTO()	32

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

name
public String **name**

value

public Object **value**

Constructor Detail

AttributeDTO
public **AttributeDTO**()

Class ChildResourceRefDTO

[org.osgi.service.onem2m.dto](#)

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.ChildResourceRefDTO
```

```
public class ChildResourceRefDTO
extends org.osgi.dto.DTO
```

DTO expressing ChildResourceRef.

Field Summary		Pag e
String	**[name](#)**	33
String	**[specializationID](#)**	33
Integer	**[type](#)**	33
String	**[uri](#)**	33

Constructor Summary	Pag e
[ChildResourceRefDTO](#)()	34

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

uri
```
public String uri
```

name

```
public String name
```

type

```
public Integer type
```

specializationID

```
public String specializationID
```

Constructor Detail

ChildResourceRefDTO

```
public ChildResourceRefDTO()
```

Class DasInfoDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └org.osgi.dto.DTO
   └org.osgi.service.onem2m.dto.DasInfoDTO
```

```
public class DasInfoDTO
extends org.osgi.dto.DTO
```

DTO expressing DasInfo. DAS is short for Dynamic Authorization Server.

Field Summary		*Pag e*
Map<String ,Object>	**dasRequest**	35
String	**securedDasRequest**	35
String	**uri**	35

Constructor Summary	*Pag e*
DasInfoDTO()	35

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

uri
```
public String uri
```

dasRequest

```
public Map<String,Object> dasRequest
```

securedDasRequest

```
public String securedDasRequest
```

Constructor Detail

DasInfoDTO
```
public DasInfoDTO()
```

Class FilterCriteriaDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.FilterCriteriaDTO
```

```
public class FilterCriteriaDTO
extends org.osgi.dto.DTO
```

DTO expressing FilterCriteria. This data structure is used for searching resources.

Nested Class Summary		Page

Package org.osgi.service.onem2m.introspection

This package include interfaces for providing information of data structures and checking validity.

See:
> *Description*

Interface Summary		*Page*
FlexContainerIntrospector	FlexContainerInspector provides information of sub data structures and validity of data structure for FlexContainer Resource.	77
Introspector	Inspector provides information of sub data structures and validity of data structure of oneM2M, except FlexContainer.	79

Enum Summary		*Page*
Optionality	Enum expressing optionality of fields.	82

Package org.osgi.service.onem2m.introspection Description

This package include interfaces for providing information of data structures and checking validity.

Interface FlexContainerIntrospector

org.osgi.service.onem2m.introspection

---

public interface **FlexContainerIntrospector**

FlexContainerInspector provides information of sub data structures and validity of data structure for FlexContainer Resource.

Method Summary		*Page*
String[]	**findValidationProblems**(ResourceDTO resource) Execute Validation of Data Structure	77
String[]	**getCustomeAttributeNames**(String containerDefinition) get Possible Attributes for the given resourceType.	77
Optionality	**getOptionality**(String containerDefinition, String attributeName) get optionality of specified attribute	77
Object	**getTemplateObject**(String containerDefinition, String customAttributeName) return Typical Data Structure for Type for given attribute of resource type	78
Class	**getType**(String containerDefinition, String attributeName) return Java Type for given attribute of resource type	78

Method Detail

findValidationProblems

String[] **findValidationProblems**(ResourceDTO resource)

Execute Validation of Data Structure

Returns:
array of problems

---

getCustomeAttributeNames

String[] **getCustomeAttributeNames**(String containerDefinition)

get Possible Attributes for the given resourceType.

Returns:
array of Possible Attributes

---

getOptionality

Optionality **getOptionality**(String containerDefinition,
                              String attributeName)

get optionality of specified attribute

Parameters:
       `containerDefinition` - container definition
       `attributeName` - attribute name
Returns:
       optionality of the attribute

---

getType

```
Class getType(String containerDefinition,
              String attributeName)
```

return Java Type for given attribute of resource type

Parameters:
       `containerDefinition` - container definition of flexContainer
       `attributeName` - attribute name
Returns:
       expected class for the specified attribute

---

getTemplateObject

```
Object getTemplateObject(String containerDefinition,
                         String customAttributeName)
```

return Typical Data Structure for Type for given attribute of resource type

Parameters:
       `containerDefinition` - container definition of flexContainer
Returns:
       Template Object

Interface Introspector

org.osgi.service.onem2m.introspection

```
public interface Introspector
```

Inspector provides information of sub data structures and validity of data structure of oneM2M, except FlexContainer.

Method Summary		*Page*
`String[]`	**findValidationProblems**(RequestPrimitiveDTO req) execute Validation of Data Structure	79
`String[]`	**findValidationProblems**(ResponsePrimitiveDTO resp) execute Validation of Data Structure	79
`String[]`	**findValidationProblemsForCreate**(ResourceDTO resource) execute Validation of Data Structure	80
`String[]`	**findValidationProblemsForUpdate**(ResourceDTO resource) execute Validation of Data Structure	80
`String[]`	**getAttributeNames**(int resourceType) get Possible Attributes for specified resourceType.	80
Optionality	**getOptionalityForCreate**(int resourceType, String attributeName) get Optionality of specified attribute in create operation.	80
Optionality	**getOptionalityForUpdate**(int resourceType, String attributeName) get Optionality of specified attribute in update operation.	80
`Object`	**getTemplateObject**(int resourceType, String Attribute) return Typical Data Structure for Type of specified attribute of resource type	81
`Class`	**getType**(int resourceType, String attributeName) return Java Type for given attribute of resource type	81

Method Detail

findValidationProblems

```
String[] findValidationProblems(ResponsePrimitiveDTO resp)
```

execute Validation of Data Structure

Returns:
array of problems

---

findValidationProblems

```
String[] findValidationProblems(RequestPrimitiveDTO req)
```

execute Validation of Data Structure

Returns:
array of problems

findValidationProblemsForCreate

`String[] `**`findValidationProblemsForCreate`**`(`<u>`ResourceDTO`</u>` resource)`

execute Validation of Data Structure

Returns:
array of problems

findValidationProblemsForUpdate

`String[] `**`findValidationProblemsForUpdate`**`(`<u>`ResourceDTO`</u>` resource)`

execute Validation of Data Structure

Returns:
array of problems

getAttributeNames

`String[] `**`getAttributeNames`**`(int resourceType)`

get Possible Attributes for specified resourceType.

Returns:
array of Possible Attribute Names

getOptionalityForCreate

<u>`Optionality`</u>` `**`getOptionalityForCreate`**`(int resourceType,`
`                                     String attributeName)`

get Optionality of specified attribute in create operation.

Parameters:
`resourceType` - resource type
`attributeName` - attribute Name
Returns:
Optionality

getOptionalityForUpdate

<u>`Optionality`</u>` `**`getOptionalityForUpdate`**`(int resourceType,`
`                                     String attributeName)`

get Optionality of specified attribute in update operation.

Parameters:
`resourceType` - resource type

attributeName - attribute Name
Returns:
Optionality

getType

```
Class getType(int resourceType,
              String attributeName)
```

return Java Type for given attribute of resource type

Parameters:
resourceType - resource type
attributeName - attribute Name
Returns:
expected class for the specified attribute

getTemplateObject

```
Object getTemplateObject(int resourceType,
                         String Attribute)
```

return Typical Data Structure for Type of specified attribute of resource type

Returns:
Template Object

Enum Optionality

org.osgi.service.onem2m.introspection

```
java.lang.Object
  └─ java.lang.Enum<Optionality>
      └─ org.osgi.service.onem2m.introspection.Optionality
```

All Implemented Interfaces:
Comparable<Optionality>, Serializable

```
public enum Optionality
extends Enum<Optionality>
```

Enum expressing optionality of fields.

Enum Constant Summary	Page
Mandatory	82
NotPresent	82
Optional	82

Method Summary		Page
static Optionality	**valueOf**(String name)	83
static Optionality[]	**values**()	82

Enum Constant Detail

Mandatory
public static final Optionality **Mandatory**

Optional

public static final Optionality **Optional**

NotPresent

public static final Optionality **NotPresent**

Method Detail

values
public static Optionality[] **values**()

---

valueOf

```
public static Optionality valueOf(String name)
```

8 Considered Alternatives

For posterity, record the design alternatives that were considered but rejected along with the reason for rejection. This is especially important for external/earlier solutions that were deemed not applicable.

8.1 Representation of DTO
8.1.1 JAXB generated Class

As alternative solution, utilization of generated Java classes by JAXB has been considered, since oneM2M provides well defined XSD for defining data format. With the following aspects, this approach is not applied.

Many classes: Currently 65 XSD files are defined in oneM2M specification and JAXB tool (xjc) generates more than 140 Java classes. Using many classes as interface could make specification more complicated than its nature.

No Uniqueness: Generated classes by xjc are not unique, because it is possible to customize generation processes.

Changeability: Depending on the version of oneM2M, XSD files differ. It is preferable to choose version independent API, as much as possible. oneM2M ensures any data can be converted to JSON and CBOR, so proposed approach can be used with out modification, even if XSD file would be changed.

8.1.2 Generic DTO

Genric DTO, which has Map<String, Obj> in the top, has been discussed in Gent meeting. But it seems bad usage of defining DTO.

8.1.3 Specific DTO

SpecificDTO definitions have been generated from XSD generated classes. The number of DTO exceeds 170 and Java doc pages are getting 300 pages. It is apparently too much to express data formats. So middle approach of generic DTO and specific DTO has been chosen.

8.2 Resource Types Expression

In DTO, enum was eagerly used for clear candidates of possible values. But resource types seems more fragile because new resource types could be easily added. So Integer was chosen for resource types.

8.3 Use of Annotation defined by JAXB in DTO

Currently annotations defined by JAXB was used in DTO. It was pointed out as confusing because it might give impression that it only support XML serialization. But it was kept in the definitions by following reasons.

1. Removing the annotations are easier than inserting.

2. It is informative to specify optionality.

New OSGI annotation specifying optionality could be possible, but it might take time because it should be published as Core specification and R7 just has released.

9 Security Considerations

Description of all known vulnerabilities this may either introduce or address as well as scenarios of how the weaknesses could be circumvented.

9.1 ProtocolBinding Service with secure protocol configuration

In case that ProtocolBinding Service uses secure protocols, it is expected to handle pre-shared key or certificate and other parameters. Those configuration could be very diverse. This is out of scope of this RFC and it is responsibility of bundle developer that provides ProtocolBindingService.

9.2 Binding of AE Core and Protocol Binding

Protocol Binding has identity information, such as a key or certificate, which represents AE, so that AE core MUST be bound to the right protocol service binding. It is implementation's responsibility of protocol binding, it SHOULD utilize Service Factory to determine calling entity.
