Service Layer API for oneM2M

Final Draft

91 Pages

Abstract

oneM2M is standard organization and specifies middleware for IoT, called Common Services Entities (CSE). Application can access functionality in CSE with RESTful operations, which are Create, Retrieve, Update, Delete and Notify. oneM2M allows variety of communication methods, 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR). This RFC describes the way to provide high level API for oneM2M RESTful operations hiding the difference of variety of communication methods.

Revision	Date	Comments
Initial	*SEP 15 2017*	Initial Contribution. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp
0.0.1	*SEP 21 2017*	Updated alternatives, some figures, added description on validator. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp

Revision	Date	Comments
0.0.2	*April 17 2018*	Update based on discussion in Washington meeting. Hiroyuki Maeomichi, NTT, maeomichi.hiroyuki@lab.ntt.co.jp
0.0.3	*June 22 2018*	Add new fields and class reflecting R3 draft of oneM2M: Added fields in RequestPrimitiveDTO, ResponsePrimitiveDTO, and FilterCriteriaDTO, and ReleaseVersion enum. Organize DTOs: Added AttributeDTO, LocalIdTokenIdAssigmentDTO, and DasInfoDTO and remove DynAuthLocalIdAssignmentsDTO and DynAuthReqInfoDTO Introduce OperationIF interface as a super interface of ProtocolBinding interface and CSE interface for enabling concise application code. This replaces former simple.Client. Organize Introspection interfaces with less methods. They are moved to dedicated package.
0.0.4	*June 25 2018*	Add section 'Mapping Rules for Generic DTO' Update Javadoc with more explanations. (moved old classes to org.osgi.service.onem2m.old package for preparing deletion.) Add description to Security Consideration section. Add oneM2M R3 specs and XSD to references.
0.0.5	*Jun 27 2018*	Modified after discussion in Washington DC F2F. Restructure service interfaces; now 2 interface is remaining. For receiving notification, dedicated interface is prepared. Remove Introspection interfaces. Reduce service properties by removing ones for informative purpose. Add example flow to control devices. Modify security consideration in section 9.2.
0.06	*Jun 29 2018*	Add examples, with code snipets. Add 'Data Modification in Protocol Binding' section. Add discovery() method with additional parameter.
0.07	*Sep 17 2018*	Remove all service properties. Add some reasons to considered alternative section.
0.0.8	*May 22 2019*	Add configuration chapter.(5.4) Fix API parameter.

Revision	Date	Comments
0.1	*Feb 04 2020*	Remove configuration chapter (introduce 0.0.8)
		Fix Figure, typo.
		Add GenericDTO
		Remove Instruction(in red text)

1   Introduction

oneM2M is standard organization and specifies middleware for Internet of Things (IoT), called Common Services Entities (CSE). Applications can access CSE's functionality with RESTful operations, which are Create, Retrieve, Update, Delete and Notify. TS-0001 [2] defines more than 40 resource types to expose CSE's functionalities. oneM2M allows variety of communication methods, combination of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR).

 This RFP discuss the way to provide high level API (namely service layer API) for oneM2M RESTful operations hiding the difference of variety of communication methods.

2   Application Domain

2.1   IoT Application configuration using oneM2M

oneM2M's middleware, called CSE can be deployed in different locations and they are connected each other forming tree topology. Depending on deployed location, CSEs are categorized to 3 types, IN-CSE, MN-CSE and ASN-CSE. IN-CSE is located top of tree, ASN-CSE is located at leaf and MN-CSE is located and MN-CSE is located on middle.
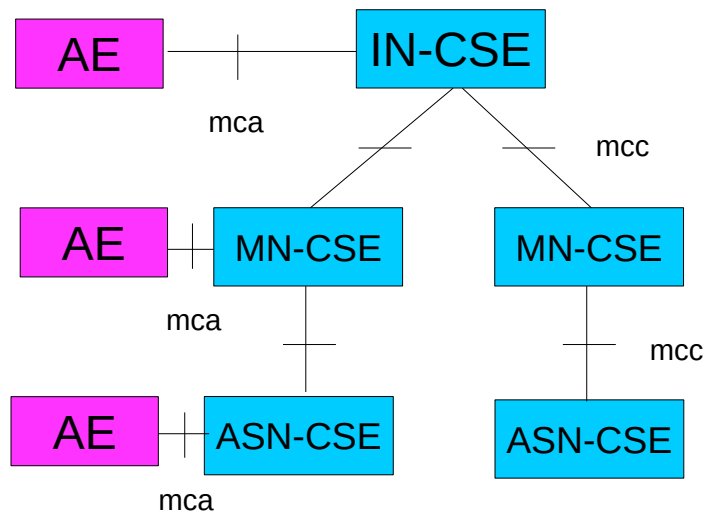

oneM2M's application, called Application Entity (AE) connects to one of CSEs. After AE connecting to the CSE, AE can access to all of CSEs, by retargeting function (similar to routing) of CSEs.

AE accesses to CSE's functionality through RESTful API, which consists of Create, Retrieve, Update, Delete and Notify in targeting more than 40 types of resources. For examples, typical resources are *<contentInstance>* that expresses IoT data and *<container>* that holds set of *<contentInstance>*s. AE can create or retrieve the <contentInstance> on any CSE by the retargeting functionality, as far as permission is allowed. Interface between CSEs is called *mcc* and interface between CSE and AE is called *mca,* both interfaces have almost same interface.

It is possible to develop variety types of distributed applications using the architecture. For example for IoT data aggregation applications, it is possible to develop gradual aggregation type or direct aggregation type. In gradual aggregation type, AE connected to ASN-CSE creates *<conentInstance>*s in ASN-CSE, and intermediate applications calculate statistics and put the result on IN-CSE as a *<contentInstance>*, while, in direct aggregation type, AE connected to ASN-CSE creates *<contentInstance>*s in IN-CSE directly.

Under CSE layer, oneM2M specifies NSE(Network Services Entity), but this RFC doesn't cover the NSE layer.
2.2   Communication methods used in oneM2M

oneM2M allows variety of communication methods, combination of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR). It might be added in future. oneM2M specifies specification in different level.

 Firstly TS-0001[2] specifies high level resource definitions, it defines more than 40 resource types, such as <contentInstance> for storing IoT data, <timeSeriesInstance> for periodic sensor measurement with leap detection mechanism.

 Secondly TS-0004[3] specifies procedures and serializations in independent manner from protocol bindings. Resource type and protocol data unit are defined using XSD for XML serialization. Mapping between XML and other serializations are also specified.

Thirdly TS-0008, TS-0009, TS-0010, TS-0020 specify protocol specific details for CoAP, HTTP, MQTT and Web Socket respectively.

2.3   Long name and short name

oneM2M introduced two types of notation, called long name and short name for resource types, attribute and so on. Long name is human friendly string and specifications mainly use this notation, while short name is short string consist of typically 2 or 3 characters (but not limited and sometimes longer) and communication protocol use this notation. In most cases, the initial characters of long name are assigned as short name, for examples, ct for CreationTime and at for AnnounceTo.

3   Problem Description

oneM2M specifies protocol based interface, but doesn't specify programing level API. As previously mentioned oneM2M allows variety of communication methods which are the combinations of 4 protocol bindings (HTTP, MQTT, CoAP, Websocket) and 3 serializations (XML, JSON, CBOR).

First problem is application portability. Without standardized API, application program tends to depend on the communication method initially intend to use and it will became hard to run another environment in which uses another communication method. (For example, an application designed for XML/HTTP, tend to run on environment use JSON/Websocket)

Second problem is the latency of the communication between CSE and application. Even if CSE and application is located in the same box, current oneM2M specifications define methods through protocols which requires serialization/deserialization of data, context-switch of applications, validation of incoming data and resulted in large latency compared to the situation both CSE and Application resides in the same Java VM and communicate with Java interfaces. Large latency reduces applicable area of oneM2M based solution.

Third problem is the complexity of handling of long name and short name. Even if short name is defined by trying to use initial characters, it is not straight forward to translate them in head.

4   Requirements

- R0010 – The solution MUST provide means to access outer CSE from application.

- R0011 – The solution MUST provide means to access outer CSE from client CSE.

- R0012 – The solution MUST provide means to select a communication method for application.

- R0013 – The solution MUST provide means to select a communication method for client CSE.

- R0020 – The solution MUST provide means for CSE to accept requests form outer CSE.

- R0020 – The solution MUST provide means for CSE to accept requests form outer application.

- R0030 – The solution MUST provide means to communicate through Java interface between CSE and application that are located in the same OSGi framework.

- R0040 – The solution SHOULD hide differences of communication methods, which are combinations of 4 protocol bindings and 3 serializations (XML, JSON, CBOR).

- R0050 – The solution SHOULD provide developer friendly way for handling short names.

- R0060 – The solution MUST provide asynchronous interface using 'call by value', such as DTO.

5   Technical Solution

5.1   Overview for the solution

Protocol binding service is introduced to handle different protocols and serializations. oneM2M application uses the protocol binding service through Service Layer Interface to communicate CSE. The interface is protocol and serialization agnostic interface; it has no protocol and serialization specific methods, parameters, so that application can communicate to CSE without knowing which protocol is actually used.
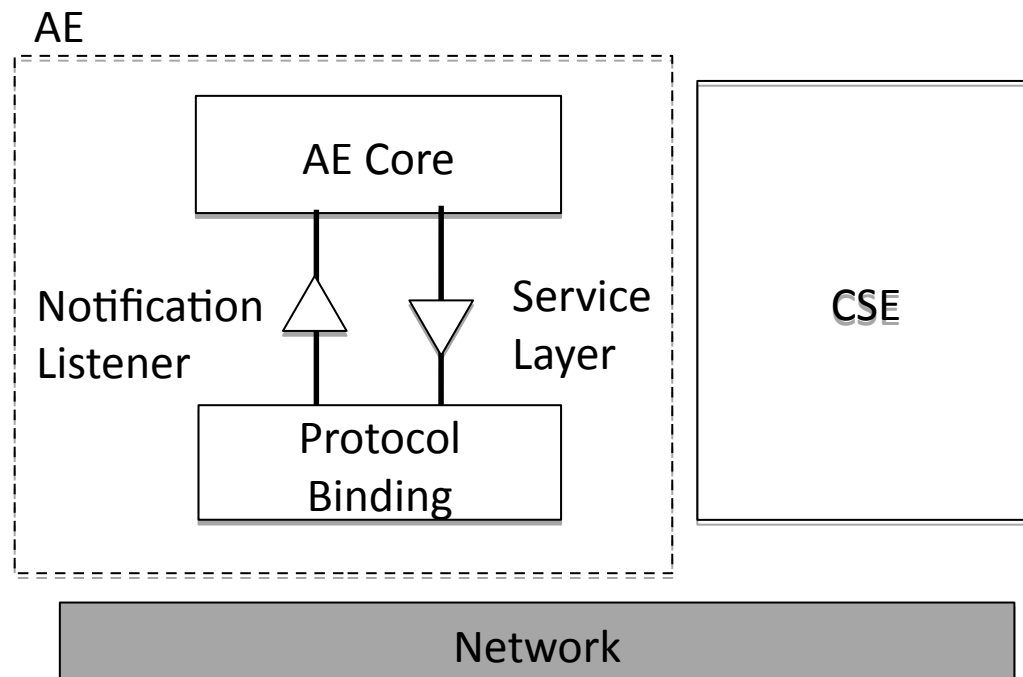

In figure, the term of Core is introduced for AE Core and CSE Core. This is for specifying parts which does not contain ProtocolBinding of AE and CSE.

Another use case is that the AE Core and the CSE core are located on the same OSGi Framework. In this use case, the AE Core and the CSE core communicate directly with ServiceLayer API, without inter-mediating ProtocolBinding Services. Following figure depicts overall configuration. Though this type of communication is not clearly defined in oneM2M specification, communicating directly without serializing data between AE and CSE allows shorter latency and less computational resources.
Following figure (right hand side) shows potential implementation of CSE, which are consisted fo CSE core and Protocol Binding Service, as symmetric to AE side. APIs defined in this RFC is consistent with the usage, but this RFC does not mandate that usage and it is left to implementor's choice.

5.2   Service Layer Interfaces

Service Layer Interface is for allowing AE to send request and get response.

request() method allows very raw data type access and it enables all possible message exchanges among oneM2M entities,

```
Promise<ResponseDTO> request(RequestDTO request);
```

Meanwhile, it can be redundant to application developers, because they need to write composition of requestPrimitive and decomposition of responsePrimitive. This interface is provided for application developer allowing less application codes. It provides methods with higher level of abstraction; operation level of resource such as create, retrieve, update, delete and so on. They do not cover all of possible message exchange but do typical ones.

Note: If this RFC doesn't provide these methods, developers likely to create similar ones in their own (various) way.

```
package org.osgi.service.onem2m.servicelayer;

import org.osgi.onem2m.dto.RequestDTO;
import org.osgi.onem2m.dto.ResponseDTO;
import org.osgi.util.promise.Promise;
```

```java
/**
 * Service Layer Interface, which locates between AE and Protocol Binding Service.
 */
public interface ServiceLayer {
      /**
       * send a request.
       *
       * @param request request
       * @return promise for ResponseDTO.
       */
      Promise<ResponseDTO> request(RequestDTO request);

      /**
       * create resource
       *
       * @param uri URI for parent resource
       * @param resource resource data
       * @return Promise of created resource
       */
      public Promise<ResourceDTO> create(String uri, ResourceDTO resource);

      /**
       * retrieve resource
       *
       * @param uri URI for retrieving resource
       * @return retrieved resource data
       */
      public Promise<ResourceDTO> retrieve(String uri);

      /**
       * retrieve subset of attributes.
       *
       * @param uri URI for retrieving resource
       * @param targetNames attribute names for retrival
       * @return retrieved resource data
       */
      public Promise<ResourceDTO> retrieve(String uri, List<String>
targetAttributes);

      /**
       * update resource
       *
       * @param uri URI for updating resource
       * @param resource data resource
       * @return updated resource
       */
      public Promise<ResourceDTO> update(String uri, ResourceDTO resource);
```

```java
/**
 * delete resource
 *
 * @param uri target URI for deleting resource
 */
public Promise<Boolean> delete(String uri);

/**
 * find resources
 *
 * @param uri URI for top of search
 * @param fc filter criteria
 * @return list of URIs matching the condition specified in fc
 */
public Promise<List<String>> discovery(String uri, FilterCriteriaDTO fc);

     /**
 * find resources
 *
 * @param uri URI for top of search
 * @param fc filter criteria
 * @param drt Discovery Result Type (structured/unstructured)
 * @return list of URIs matching the condition specified in fc
 */
public Promise<List<String>> discovery(String uri, FilterCriteriaDTO
fc, RequestPrimitiveDTO.DiscoveryResultType drt);

/**
 * send notification
 *
 * @param notification
 */
public Promise<Boolean> notify(String uri, NotificationDTO notification );

}
```

5.3   Service Property for Interfaces

No service properties are defined for ServiceLayer interface and NotificagtionListener interface.

5.4 Service Binding

Proper instance of ServiceLayer Service must be bound to proper AE Core. Implementation of ServiceLayer should created by ServiceFactory to provide a proper service instance depending on calling AE Core.

5.5 Data Modification in ServiceLayer Service

Usually ServiceLayer service doesn't change any logical information on passing data, but as an exception ServiceLayer service modifies the passing data by adding pointOfAccess information on following case.

1. create() for <AE> resource

2. update() for <AE> only when pointOfAccess'is specified.

3. request() when content is equivalent to above.

This is because AE Core entity doesn't know the pointOfAccess information and processing show above simply solve the problem.

5.6 Example: Registration

This section explains how application registers to its hosting CSE. In order to interact with the oneM2M system the bundle obtains a reference to the `ServiceLayer` service from the service registry

```
@Component
public class MyLightSwitchComponent {
@Reference
ServiceLayer client
}
```

After getting client, it starts registration by creating <AE> resource.<AE> resource creation requires App-ID, AE-ID, requestReachability attributes. In the following code, "C" is passed for AE-ID, this means asking CSE for assigning the value. Assigned value is is included in returned resource

The information of pointOfAccess is kept in ServiceLayer Service, it is assigned by ServiceLayer Service. before sending the request message to network. The value is also returned in response.

After success response of <AE> resource, it registers NotificationListener with returned AE-ID and pointOfAccess as the service property

```
@Component
public class RegistrationExample implements NotificationListener {
```

```java
@Reference
ServiceLayer client;

BundleContext context;
 @Activate
 void start(BundleContext context) {
        this.context = context;

        // create AE: This means registration.
        ResourceDTO dto = new ResourceDTO();
        dto.resourceType = ResourceType.AE.getValue();
        dto.attribute.put("App-ID", "01.com.company.lightApp1<");
        dto.attribute.put("AE-ID", "C");
        dto.attribute.put("requestReachability", Boolean.TRUE);
        final Promise<ResourceDTO> ret = client.create("/CSE1/-", dto);

        ret.onResolve(new Runnable() {
                public void run() {
                         ResourceDTO ae = null;
                        try {
                                ae = ret.getValue();
                        } catch (Exception e) {
                                e.printStackTrace();
                                return;
                        }
                         Dictionary prop = new Properties();
                         prop.put("AE-ID",ae.attribute.get("AE-ID"));
                         prop.put("PoA",ae.attribute.get("pointOfAccess"));
                         context.registerService(new String[] {"org.osgi.service.onem2m.
NotificationListener"}, this, prop);
                }
        });
   }

    @Override
    public void notified(RequestPrimitiveDTO request) {
```

```
        //....
    }
```

Following figure shows sequence diagram of the registration flow.
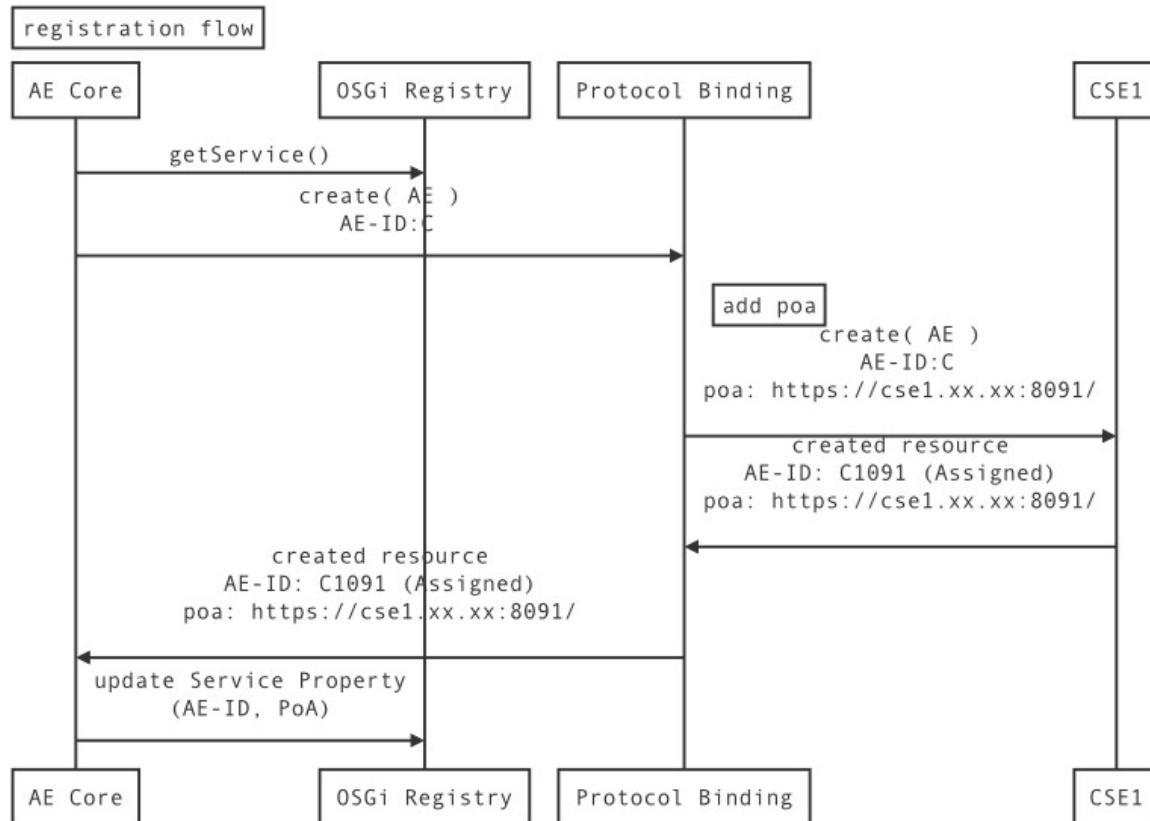

5.7 Example: Turning Light ON

This section explains how application turns on the lights located on remote site. There are mainly two ways to represent devices in oneM2M.

First way uses <flecContainer> resource type for representing device, its status, and so on. The resource type is introduced in oneM2M release 2 and it allows having custom attributes in it. Based on the resource, variety of the data model for devices, especially of home domain, are specified in TS-0023. With this way application can use standardized data model and operate device status in commonly used manner.

Second way uses <container> and <contentInstance> resource types for representing device and its status. These resource types are introduced very beginning of oneM2M and this approach is well explained in developer guide (TR-0025 [TODO ref. WEB]) Meanwhile, the resource type is not primarily designed for this purpose, but for storing data, so that how to operate device could be different from usual manner. To change state, new

<contentInstance> is created with new status in its content attribute. <container> usually has multiple <contentInstance>s underneath and the latest one is supposed to be the latest status.

5.7.1 Example (Using <flexContainer>

In this example a simple bundle wishes to swtich light devices on when the bundle is started, and switch them off again when the bundle is stopped. Here it is assumed that registration process described in the previous section is done.

1. When the bundle has obtained a reference to the ServiceLayer then it can use the `discover` method to find all of the lightbulbs in the system

```java
public class MyLightSwitchComponent {

@Reference

ServiceLayer client;

Promise<List<String>> discoveredLightbulbs;

@Activate

void start() {

  discoveredLightbulbs = findLightBulbs();

}

private Promise<List<String>> findLightBulbs() {

    String baseURI = "/homegateway/-/"; // - means CSE Base ( kaid of top directory )

    FilterCriteriaDTO filter = new FilterCriteriaDTO();

    filter.resourceType = Collections.singletonList(

      ResourceType.flexContainer.getValue());

    AttributeDTO attr = new AttributeDTO();

    attr.name = "contentDefinition";

    attr.value = "org.onem2m.home.device.light";

    filter.attribute = Collections.singletonList(attr);

    filter.filterOperation = FilterCriteriaDTO.FilterOperation.AND;

    return client.discovery(baseURI, filter);

}
}
```

2. Once the lightbulbs are discovered then the bundle can switch on the bulbs by creating a content instance using the `update` method

```java
public class MyLightSwitchComponent {
@Reference
ServiceLayer client;
Promise<List<ResourceDTO> allTurnedOn;

@Activate
void start() {
  allTurnedOn = findLightBulbs().
        flatMap(l -> Promises.all(
            l.stream()
                .map(this::turnOn)
                .collect(toList()))));
}

private Promise<ResourceDTO> turnOn(String bulbUri) {
  ResourceDTO dto = new ResourceDTO();
  dto.attribute.put("powerStatus", Boolean.TRUE);
  return client.update(bulbUri + "/binarySwitch", dto );
}
}
```

3. Finally, the bulbs can be turned off again when the bundle is stopped.

```java
public class MyLightSwitchComponent {
@Reference
ServiceLayer client;
Promise<List<ResourceDTO> allTurnedOn;

@Deactivate
void stop() {
    findLightBulbs().flatMap(l -> Promises.all(
        l.stream()
            .map(this::turnOff)
      .collect(toList()))));
}
}
```

Following figure shows the example showing how application turn on the light device on the remote.
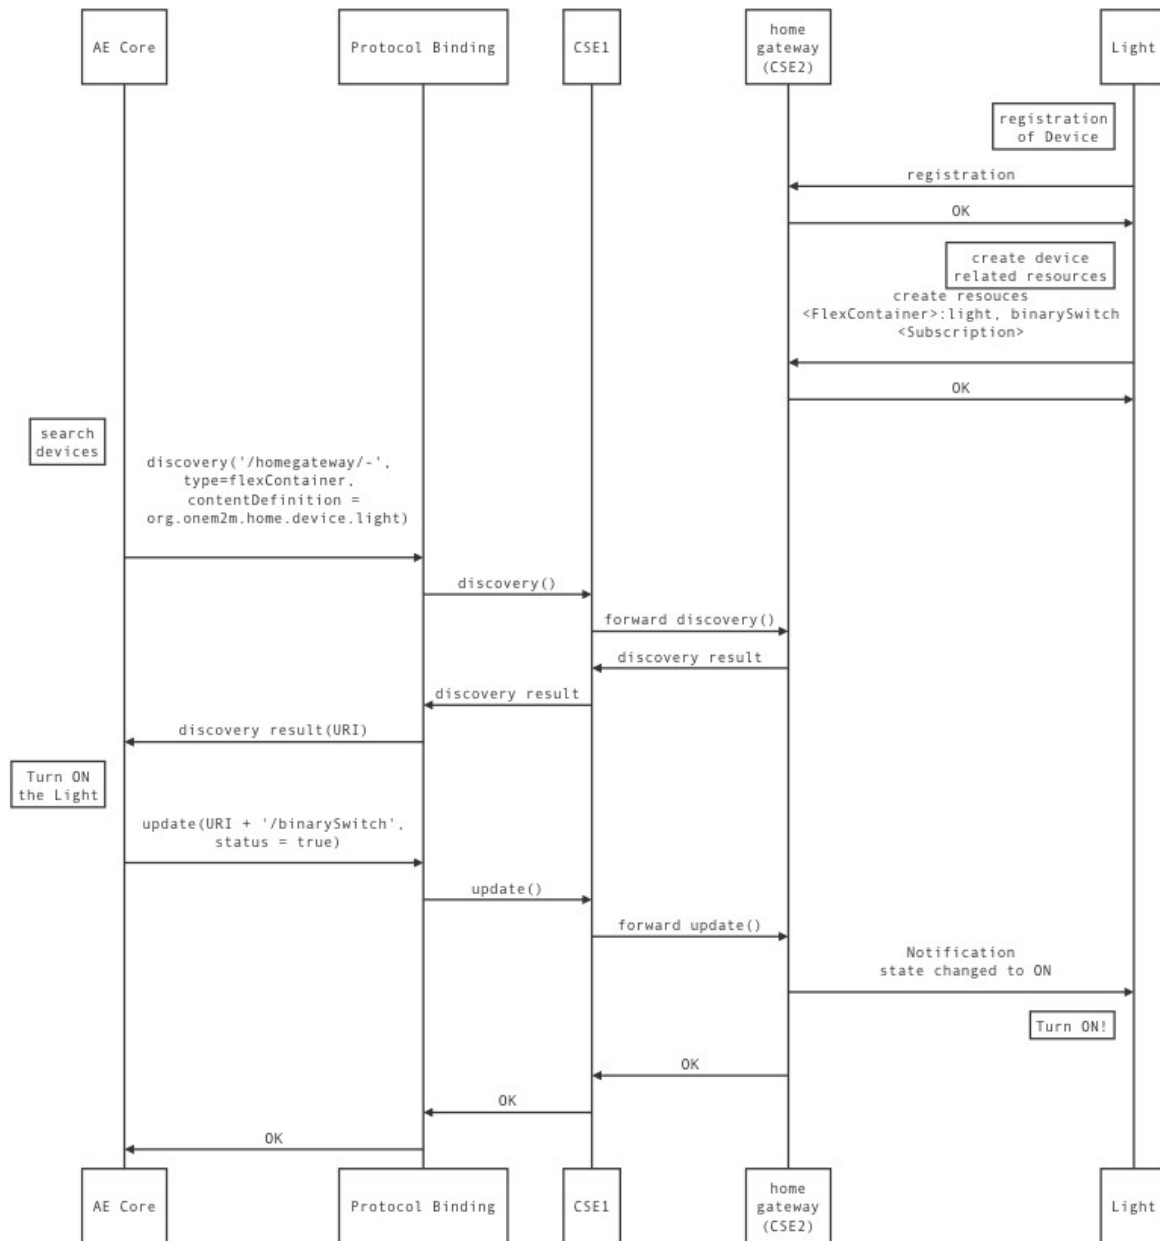

5.7.2 Example (Using <container> and <contentInstance>

In this example, device is expressed as <container> resource type in remote CSE (Home Gateway). Discovery is changed as follows. Here it assumes that all <container>s representing lightbulb have label of "lightBulb".

```
private Promise<List<String>> findLightBulbs() {
```

```
        String baseURI = "/homegateway/-/"; // - means CSEBase ( kind of top directory )

        FilterCriteriaDTO filter = new FilterCriteriaDTO();
        filter.resourceType = Collections.singletonList(
            ResourceType.container.getValue());
        filter.labels = Collections.singletonList("lightBulb");
        filter.filterOperation = FilterCriteriaDTO.FilterOperation.AND;
        return client.discovery(baseURI, filter);
}
```

Light can be controlled by creating new <contentInstance> resource as follows.

```
    private Promise<ResourceDTO> turnOn(String bulbUri) {
        ResourceDTO dto = new ResourceDTO();
        dto.resourceType = ResourceType.container.getValue();
        dto.attribute.put("content", "ON");
        return client.create(bulbUri , dto );
    }
```

6   Data Transfer Objects

6.1   Design Policy of DTOs

Data transfer Object was chosen as data object passing by the interfaces, following OSGi's design convention. Though data structure near root structures are designed specific DTO, deeper data types are to be stored as generic types, such as Map, List and Wrapper classes of Java Primitives. Following figure depict reference relationship among object. (See also the considered Alternatives)

In the class definition, some data types are shown as Object, but the assigned value shall be a type that is allowed for OSGi DTO.
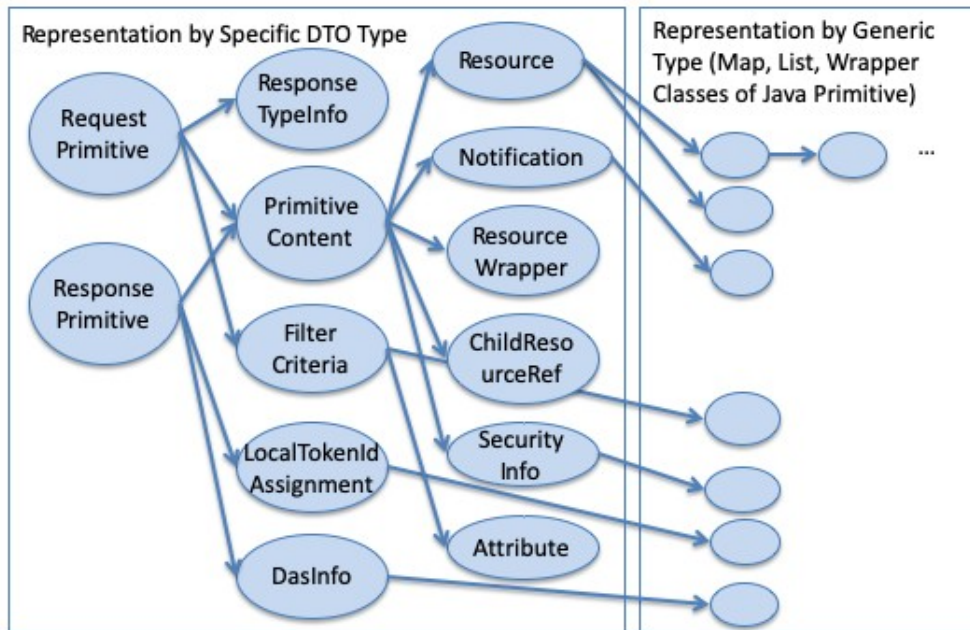

In figure, followed 'DTO' is committed.

6.2   RequestPrimitiveDTO

RequestPrimitiveDTO holds a Request Information used for oneM2M communication.

```
package org.osgi.service.onem2m.dto;

import java.util.*;

public class RequestPrimitiveDTO extends org.osgi.dto.DTO {
```

```java
    public Operation operation;

    public String to;
    public String from;

    public String requestIdentifier;

    public Integer resourceType;
    public PrimitiveContentDTO content;
    public List<String> roleIDs;

    public String originatingTimestamp;
    public String requestExpirationTimestamp;
    public String resultExpirationTimestamp;
    public String operationExecutionTime;

    public ResponseTypeInfoDTO responseType;
    public String resultPersistence;

    public ResultContent resultContent;
    public String eventCategory;

    public Boolean deliveryAggregation;
    public String groupRequestIdentifier;
    public FilterCriteriaDTO filterCriteria;

    public DiscoveryResultType discoveryResultType;
    public String tokens;
    public List<String> tokenIDs;
    public List<String> localTokenIDs;

    public Boolean tokenReqIndicator;

    // Added at R3.0
    public List<String> groupRequestTargetMembers;
    public Boolean authSignatureIndicator;
    public List<String> authSignature;
    public Boolean authRelationshipIndicator;
    public Boolean semanticQueryIndicator;
    public ReleaseVersion releaseVersion;
    public String verndorInformation;

    public static enum DiscoveryResultType {
        structured(1), unstructured(2);
        // omitted
    }
```

```
        public static enum ResultContent {
                nothing(1), attributes(2), hierarchicalAddress(3),
                hierarchicalAddressAndAttributes(4),
attributesAndChildResources(5),
attributesAndChildResourceReferences(6),
childResourceReferences(7), originalResource(8), childResources(9);

                // omitted
        }

        public static enum Operation {
                Create(1), Retrieve(2), Update(3), Delete(4), Notify(5);
                // omitted
        }

}
```

6.3   ResponsePrimitiveDTO

ResponsePrimitiveDTO holds a Response Information used for oneM2M communication.

```
package org.osgi.service.onem2m.dto;
import java.util.*;

public class ResponsePrimitiveDTO extends org.osgi.dto.DTO{

        public Integer responseStatusCode;

        public String requestIdentifier;
        public PrimitiveContentDTO content;
        public String to;
        public String from;
        public String originatingTimestamp;
        public String resultExpirationTimestamp;
        public String eventCategory;

        public ContentStatus contentStatus;

        public Integer contentOffset;
        public List<LocalTokenIdAssignmentDTO> assignedTokenIdentifiers;
        public List<DasInfoDTO> tokenReqInfo;

        // Added R3.0
        public Boolean AuthSignatureReqInfo;
```

```java
public ReleaseVersion releaseVersionIndicator;
public String vendorInformation;

public static enum ContentStatus{
        PARTIAL_CONTENT, // 1
        FULL_CONTENT;   //2

    }
}
```

6.4 ResponseTypeInfoDTO

```java
package org.osgi.service.onem2m.dto;

import java.util.*;

public class ResponseTypeInfoDTO extends org.osgi.dto.DTO {

    public java.lang.Integer responseTypeValue;

    public List<java.lang.String> notificationURI;

    public static enum ResponseType {
        nonBlockingRequestSynch(1), nonBlockingRequestAsynch(2),
blockingRequest(3), flexBlocking(4);
        // omitted.
    }
}
```

6.5 FilterCriteriaDTO

```java
package org.osgi.service.onem2m.dto;
import java.util.*;

public class FilterCriteriaDTO extends org.osgi.dto.DTO{
    public String createdBefore;
    public String createdAfter;
    public String modifiedSince;
    public String unmodifiedSince;
    public Integer stateTagSmaller;
    public Integer stateTagBigger;
    public String expireBefore;
    public String expireAfter;
```

```java
    public List<String> labels;
    public List<Integer> resourceType;

    public Integer sizeAbove;

    public Integer sizeBelow;
    public List<String> contentType;
    public AttributeDTO attribute;

    public FilterUsage filterUsage;

    public Integer limit;
    public String semanticsFilter;

    public FilterOperation filterOperation;

    public Integer contentFilterSyntax;
    public String contentFilterQuery;

    public Integer level;

    public Integer offset;

    // added in R3
    public List<String> childLabels;
    public List<String> parentLabels;
    public String labelsQuery;
    public Integer childResourceType;
    public Integer parentResourceType;
    public AttributeDTO childAttribute;
    public AttributeDTO parentAttribute;
    public String applyRelativePath;

    public static enum FilterOperation {
        AND(1), OR(2);
        // omitted...
    }

    public static enum FilterUsage {
        DiscoveryCriteria(1), ConditionalRetrival(2), IPEOndemandDiscovery(3);
        // omitted...

    }
}
```

6.6 ResourceDTO

```java
package org.osgi.service.onem2m.dto;
import java.util.*;

public class ResourceDTO extends org.osgi.dto.DTO{

    // Universal Attribute, which can be held by all resources.

    public Integer resourceType;

    public String resourceID;

    public String parentID;

    public String creationTime;

    public String lastModifiedTime;

    public String resourceName;

    // optional, Universal Attributes
    public List<String> labels;

    /**
     * Non Universal Attribute.
     * Value Part must be the types that are allowed for OSGi DTO.
     */
    public Map<String, Object> attribute;
}
```

6.7 NotificationDTO

NotificationDTO has information of notification.

```java
package org.osgi.service.onem2m.dto;
import java.util.*;

public class NotificationDTO extends org.osgi.dto.DTO{
    public Map<String,Object> notificationEvent;//NotificationEventDTO

    public Boolean verificationRequest;
```

```
public Boolean subscriptionDeletion;
public String subscriptionReference;
public String creator;
public String notificationForwardingURI;

public Map<String,Object> ipeDiscoveryRequest;//IPEDiscoveryRequestDTO
}
```

6.8   Other DTOs

There are some other DTOs, please refer Javadoc section for them.

6.9   Mapping Rules for Generic DTO

Following table summarizes mapping rule between oneM2M data types and Generic types used in DTOs. There are two types of XSD are defined in oneM2M, which are longname version and shortname version. The longname version should be referred.

oneM2M Types (XML Schema)	Type of OSGi DTO	
Basic Types of XML Schema	Wrapper Object of Java primitive	For example: xs:integer, xs:float
xs:anyURI, m2m:ID,	String	
m2m:timestamp	String	YYYYMMDDThhmmss,ssssss
m2m:absRelTimestamp	String	Union of m2m:timestamp and xs:long. This is exception of union rule above. Distinction is done by existence of 'T'
xs:sequence (as complexType)	Map	Name of element is used for key of map.
xs:list, xs:sequence (as list)	List	
xs:union	Map	Base attribute of restriction tag is used for key of map. Only one key is allowed. See Example of missingDataList:

Following XML is an example of missingData.

<xs:simpleType name="missingDataList">

   <xs:union>

     <simpleType>

         <restriction base='m2m:listOfTimeStamp' />

```
</simpleType>

<simpleType>

    <restriction base='m2m:listOfRelTimeStamp' />

</simpleType>

</xs:union>

</xs:simpleType>
```

7 Javadoc

Please include Javadoc of any new APIs here, once the design has matured. Instructions on how to export Javadoc for inclusion in the RFC can be found here: https://www.osgi.org/members/RFC/Javadoc

OSGi Javadoc

Package Summary		Page
org.osgi.service.onem2m		31
org.osgi.service.onem2m.dto		37

Package org.osgi.service.onem2m

Interface Summary		*Page*
NotificationListener	Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.	32
ServiceLayer	Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.	34

Exception Summary		*Page*
OneM2MException	General Exception for oneM2M.	33

Interface NotificationListener

org.osgi.service.onem2m

public interface **NotificationListener**

Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.

Method Summary		*Pag e*
void	**notified**(RequestPrimitiveDTO request) receive notification.	32

Method Detail

notified

void **notified**(RequestPrimitiveDTO request)

receive notification.

Parameters:
request - request primitive

Class OneM2MException

org.osgi.service.onem2m

```
java.lang.Object
 └─java.lang.Throwable
    └─java.lang.Exception
       └─java.io.IOException
          └─org.osgi.service.onem2m.OneM2MException
```

All Implemented Interfaces:
Serializable

```
public class OneM2MException
extends IOException
```

General Exception for oneM2M.

Field Summary			*Pag e*
	cause Cause of Exception		33
	errorCode Error Code		33

Constructor Summary	*Pag e*
OneM2MException()	33

Field Detail

errorCode

public **errorCode**

> Error Code

cause

public **cause**

> Cause of Exception

Constructor Detail

OneM2MException

public **OneM2MException**()

Interface ServiceLayer

org.osgi.service.onem2m

```
public interface ServiceLayer
```

Primary Interface for an oneM2M entity to send request and get response to/from other oneM2M entity.

Method Summary		Page
org.osgi.util.promise.Promise	**create**(String uri, ResourceDTO resource) create resource	34
org.osgi.util.promise.Promise	**delete**(String uri) delete resource	35
org.osgi.util.promise.Promise	**discovery**(String uri, FilterCriteriaDTO fc) find resources.	35
org.osgi.util.promise.Promise	**discovery**(String uri, FilterCriteriaDTO fc, RequestPrimitiveDTO.DiscoveryResultType drt) find resources	36
org.osgi.util.promise.Promise	**notify**(String uri, NotificationDTO notification) send notification	36
org.osgi.util.promise.Promise	**request**(RequestPrimitiveDTO request) send a request.	34
org.osgi.util.promise.Promise	**retrieve**(String uri) retrieve resource	35
org.osgi.util.promise.Promise	**retrieve**(String uri, List targetAttributes) retrieve subset of attributes.	35
org.osgi.util.promise.Promise	**update**(String uri, ResourceDTO resource) update resource	35

Method Detail

request

```
org.osgi.util.promise.Promise request(RequestPrimitiveDTO request)
```

send a request.

Parameters:
　　　request - request primitive
Returns:
　　　promise of ResponseDTO.

---

create

```
org.osgi.util.promise.Promise create(String uri,
                                      ResourceDTO resource)
```

create resource

Parameters:
　　　uri - URI for parent resource

        `resource` - resource data
> **Returns:**
> > Promise of created resource

---

retrieve

`org.osgi.util.promise.Promise` **`retrieve`**`(String uri)`

> retrieve resource
>
> **Parameters:**
> > `uri` - URI for retrieving resource
>
> **Returns:**
> > retrieved resource data

---

retrieve

`org.osgi.util.promise.Promise` **`retrieve`**`(String uri,`
                                       `List targetAttributes)`

> retrieve subset of attributes.
>
> **Parameters:**
> > `uri` - URI for retrieving resource
> > `targetAttributes` - names of the target attribute
>
> **Returns:**
> > retrieved resource data

---

update

`org.osgi.util.promise.Promise` **`update`**`(String uri,`
                                       [ResourceDTO](#) `resource)`

> update resource
>
> **Parameters:**
> > `uri` - URI for updating resource
> > `resource` - data resource
>
> **Returns:**
> > updated resource

---

delete

`org.osgi.util.promise.Promise` **`delete`**`(String uri)`

> delete resource
>
> **Parameters:**
> > `uri` - target URI for deleting resource

---

discovery

`org.osgi.util.promise.Promise` **`discovery`**`(String uri,`
                                       [FilterCriteriaDTO](#) `fc)`

find resources. Discovery Result Type is kept as blank and default value of target CSE is used for the parameter.

Parameters:
       `uri` - URI for top of search
       `fc` - filter criteria
Returns:
       list of URIs matching the condition specified in fc

---

discovery

```
org.osgi.util.promise.Promise discovery(String uri,
                                         FilterCriteriaDTO fc,
                                         RequestPrimitiveDTO.DiscoveryResultType drt)
```

find resources

Parameters:
       `uri` - URI for top of search
       `fc` - filter criteria
       `drt` - Discovery Result Type (structured/unstructured)
Returns:
       list of URIs matching the condition specified in fc

---

notify

```
org.osgi.util.promise.Promise notify(String uri,
                                      NotificationDTO notification)
```

send notification

Package org.osgi.service.onem2m.dto

Class Summary		Page
AttributeDTO	DTO expresses Attribute.	39
ChildResource RefDTO	DTO expressing ChildResourceRef.	40
DasInfoDTO	DTO expressing DasInfo.	42
FilterCriteriaD TO	DTO expressing FilterCriteria.	44
FilterCriteriaD TO.FilterOpera tion	Enum FilterOperation	49
FilterCriteriaD TO.FilterUsage	Enum FilterUsage	51
GenericDTO	GenericDTO expresses miscellaneous data structures.	53
LocalTokenIdA ssignmentDTO	DTO expressing LocalTokenIdAssignment.	54
NotificationDT O	DTO expressing Notification.	55
PrimitiveConte ntDTO	DTO expressing Primitive Content.	57
ReleaseVersio n	Enum expressing oneM2M specification version.	60
RequestPrimiti veDTO	DTO expresses Request Primitive.	62
RequestPrimiti veDTO.Discov eryResultType		67
RequestPrimiti veDTO.Operati on	enum type for Operation	69
RequestPrimiti veDTO.Result Content	enum type for Result Content	71
ResourceDTO	DTO expressing Resource.	74
ResourceWrap perDTO	DTO expressing ResourceWrapper.	76
ResponsePrim itiveDTO	DTO expressing Response Primitive.	77
ResponsePrim itiveDTO.Conte ntStatus	Enum ContentStatus	80
ResponseType InfoDTO	Expressing ResponseTypeInfo	82
ResponseType InfoDTO.Resp onseType	enum ResponseType	83
SecurityInfoDT O	DTO expressing Security Info.	85

SecurityInfoDTO.SecurityInfoType	Enum SecurityInfoType	87

Class AttributeDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
  └─org.osgi.dto.DTO
      └─org.osgi.service.onem2m.dto.AttributeDTO
```

```
public class AttributeDTO
extends org.osgi.dto.DTO
```

DTO expresses Attribute. This is typically used in FilterCriteriaDTO for expressing matching condition.

Field Summary	Pag e
name Attribute name	39
value Supposed value of the attribute	39

Constructor Summary	Pag e
AttributeDTO()	39

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

name

public **name**

> Attribute name

value

public **value**

> Supposed value of the attribute

Constructor Detail

public **AttributeDTO**()

Class ChildResourceRefDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.ChildResourceRefDTO
```

```
public class ChildResourceRefDTO
extends org.osgi.dto.DTO
```

DTO expressing ChildResourceRef.

Field Summary	Pag e
name name of the child resource pointed to by the URI	40
specializationID resource type specialization of the child resource pointed to by the URI in case @type represents a flexContainer.	41
type resourceType of the child resource pointed to by the URI	40
uri URI to the child resource.	40

Constructor Summary	Pag e
ChildResourceRefDTO()	41

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

uri

public **uri**

          URI to the child resource.

name

public **name**

          name of the child resource pointed to by the URI

type

public **type**

          resourceType of the child resource pointed to by the URI

specializationID

```
public specializationID
```

> resource type specialization of the child resource pointed to by the URI in case @type represents a flexContainer. This is an optional field.

Constructor Detail

ChildResourceRefDTO

```
public ChildResourceRefDTO()
```

Class DasInfoDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.DasInfoDTO
```

```
public class DasInfoDTO
extends org.osgi.dto.DTO
```

DTO expressing DasInfo. DAS is short for Dynamic Authorization Server.

Field Summary	Pag e
dasRequest Information to send to the Dynamic Authorization Server	42
securedDasRequest Secured Information to send to the Dynamic Authorization Server.	42
uri Dynamic Authorization Server URI	42

Constructor Summary	Pag e
DasInfoDTO()	43

Methods inherited from class org.osgi.dto.DTO
toString

Field Detail

uri

public **uri**

Dynamic Authorization Server URI

dasRequest

public **dasRequest**

Information to send to the Dynamic Authorization Server

securedDasRequest

public **securedDasRequest**

Secured Information to send to the Dynamic Authorization Server. JWS or JWE is assigned to this field.

Constructor Detail

DasInfoDTO

```
public DasInfoDTO()
```

Class FilterCriteriaDTO

org.osgi.service.onem2m.dto

```
java.lang.Object
 └─org.osgi.dto.DTO
    └─org.osgi.service.onem2m.dto.FilterCriteriaDTO
```

```
public class FilterCriteriaDTO
extends org.osgi.dto.DTO
```

DTO expressing FilterCriteria. This data structure is used for searching resources.

8 Considered Alternatives

8.1 Representation of DTO

8.1.1 JAXB generated Class

As alternative solution, utilization of generated Java classes by JAXB has been considered, since oneM2M provides well defined XSD for defining data format. With the following aspects, this approach is not applied.

Many classes: Currently 65 XSD files are defined in oneM2M specification and JAXB tool (xjc) generates more than 140 Java classes. Using many classes as interface could make specification more complicated than its nature.

No Uniqueness: Generated classes by xjc are not unique, because it is possible to customize generation processes.

Changeability: Depending on the version of oneM2M, XSD files differ. It is preferable to choose version independent API, as much as possible. oneM2M ensures any data can be converted to JSON and CBOR, so proposed approach can be used with out modification, even if XSD file would be changed.

8.1.2 Generic DTO

Generic DTO, which has Map<String, Obj> in the top, has been discussed in Gent meeting. But it seems bad usage of defining DTO.

8.1.3 Specific DTO

SpecificDTO definitions have been generated from XSD generated classes. The number of DTO exceeds 170 and Java doc pages are getting 300 pages. It is apparently too much to express data formats. So middle approach of generic DTO and specific DTO has been chosen.

8.2 Resource Types Expression

In DTO, enum was eagerly used for clear candidates of possible values. But resource types seems more fragile because new resource types could be easily added. So Integer was chosen for resource types.

8.3   Use of Annotation defined by JAXB in DTO

Currently annotations defined by JAXB was used in DTO. It was pointed out as confusing because it might give impression that it only support XML serialization. But it was kept in the definitions by following reasons.

1. Removing the annotations are easier than inserting.

2. It is informative to specify optionality.

New OSGI annotation specifying optionality could be possible, but it might take time because it should be published as Core specification and R7 just has released.

8.4   Service Property for Service Layer Interface

In previous version, property named as PoAforAE is supposed to attach to Service Layer Interface. The way application need to search dedicated service for the AE, however, is not easy for developers nor OSGi way. The property has been removed and matching will be done by using Service Factory and mapping of bundle location and appropriate PoA is known by the service implementation.

8.5   Service Property for Notification Listener Interface

In previous version, property named as PoA and AE-ID are supposed to attach to Notification Listener Interface.

 To attache AE-ID, application need to check result of <AE> resource creation and know modified AE-ID by CSE, and attach it as a property. This is complicated procedure and it is not a good design choice requiring all applications to implement this manner. Regarding PoA, the design that AE does not need to care of PoA was chosen.

Implementation of Service Layer Interface should manage both information by monitoring method request for creating <AE> resource and modifying the response.   [This part need to be confirmed by reference implementation.]

9   Security Considerations

9.1   ServiceLayer Service with secure protocol configuration

In case that ServiceLayer Service uses secure protocols, it is expected to handle pre-shared key or certificate and other parameters. Those configuration could be very diverse. This is out of scope of this RFC and it is responsibility of bundle developer that provides ProtocolBindingService.

9.2   Binding of AE Core and Protocol Binding

Protocol Binding has identity information, such as a key or certificate, which represents AE, so that AE core MUST be bound to the right protocol service binding. It is implementation's responsibility of protocol binding, it SHOULD utilize Service Factory to determine calling entity.
